

**ORDER NO. KM79903264C1**

**F7**

# **Service Manual**

**Compact Plain Paper FAX**

**KX-FP105**  
**(for U.S.A.)**

## **SPECIFICATIONS**

**⚠ WARNING**

This service information is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. Products powered by electricity should be serviced or repaired only by experienced professional technicians. Any attempt to service or repair the product or products dealt with in this service information by anyone else could result in serious injury or death.

**Panasonic®**

When you note the serial number, write down all 11 digitals. The serial number may be found on the bottom of the unit.

## **1. INTRODUCTION**

### **1.1. SAFETY PRECAUTIONS**

- 1. Before servicing, unplug the AC power cord to prevent an electric shock.**
- 2. When replacing parts, use only the manufacturer's recommended components.**
- 3. Check the condition of the power cord. Replace if wear or damage is evident.**
- 4. After servicing, be sure to restore the lead dress, insulation barriers, insulation papers, shields, etc.**
- 5. Before returning the serviced equipment to the customer, be sure to perform the following insulation resistance test to prevent the customer from being exposed to shock hazards.**

### **1.2. INSULATION RESISTANCE TEST**

- 1. Unplug the power cord and short the two prongs of the plug with a jumper wire.**
- 2. Turn on the power switch.**
- 3. Measure the resistance value with an ohmmeter between the jumpered AC plug and each exposed metal cabinet part (screwheads, control shafts, bottom frame, etc.).**  
**Note: Some exposed parts may be isolated from the chassis by design. These will read infinity.**
- 4. If the measurement is outside the specified limits, there is a possibility of a shock hazard.**

### 1.3. FOR SERVICE TECHNICIANS

ICs and LSIs are vulnerable to static electricity.

When repairing, the following precautions will help prevent recurring malfunctions.

1. Cover the plastic part's boxes with aluminum foil.
2. Ground the soldering irons.
3. Use a conductive mat on the worktable.
4. Do not touch the IC or LSI pins with bare fingers.

### 1.4. BATTERY CAUTION

#### CAUTION

Danger of explosion if the battery is replaced incorrectly. Replace only with the same or equivalent type recommended by the manufacturer. Discard used batteries according to following caution: Disposal of lithium batteries should be performed by permitted, professional disposal firms knowledgeable in state government federal and local hazardous materials and hazardous waste transportation and disposal requirements.

A battery continues to have no transportation limitations as long as it is separated to prevent short circuits and packed in strong packaging.

Commercial firms that dispose of any quantity of lithium cells

should have a mechanism in place to account for their ultimate disposition. This is a good practice for all types of commercial or industrial waste.

**Recommend Type Number:**

**CR2032 (BATT) Manufactured by MATSUSHITA**

**CR2032 (BATT) Manufactured by SONY**

## 1.5. AC CAUTION

For safety, before closing the lower cabinet, please make sure of the following precautions.

1. The earth lead is fixed with the screw.
2. The AC connector is connected properly.
3. Wrap the earth lead around the core 3 times.

## 1.6. PERSONAL SAFETY PRECAUTIONS

### 1.6.1. MOVING SECTIONS OF THE UNIT

Be careful not to let your hair, clothes, fingers, accessories, etc., become caught in any moving sections of the unit.

The moving sections of the unit are the rollers and a gear. There is a separation roller and a document feed roller which are rotated by the document feed motor. A gear rotates the two rollers. Be careful not to touch them with your hands, especially when the unit is operating.

### 1.6.2. LIVE ELECTRICAL SECTIONS

All the electrical sections of the unit supplied with AC power by the AC power cord are live. Never disassemble the unit for service with the AC power supply plugged in.

#### CAUTION:

**AC voltage is supplied to the primary side of the power supply unit. Therefore, always unplug the AC power cord before disassembling for service.**

## 1.7. SERVICE PRECAUTIONS

### 1.7.1. PRECAUTIONS TO PREVENT DAMAGE FROM STATIC ELECTRICITY

Electrical charges accumulate on a person. For instance, clothes rubbing together can damage electric elements or change their electrical characteristics. In order to prevent static electricity, touch a metallic part that is grounded to release the static electricity. Never touch the electrical sections such as the power supply unit, etc.

**Electrostatic Discharge!**

## 1.8. FEATURES

General

- Help function

Display:

1. HOW TO SET UP
2. JOG/AUTO DIAL
3. FAX SENDING
4. FAX RECEIVING
5. COPIER
6. Q and A

## **7. ERRORS**

## **8. REPORTS**

## **9. CALLER ID**

- LCD (Liquid Crystal Display) readout
- TAM (Telephone answering machine) interface
- IQ-FAX™ (for U.S.A. only)

This feature can only be used by those who apply to the FaxSav service.

IQ-FAX is intelligent faxing which allows you to send faxes via the internet by using the IQ-FAX button.

Behind the IQ-FAX button is the FaxSav Global Fax Network which manages the delivery of your fax to any fax machine in the world. It routes your fax via the best and most time efficient route and will automatically resend your fax for you, if the receiving fax machine is unavailable.

This "fax-only" network has the added advantage of cost efficiency due to the internet being integrated into the net work. Every fax is secure since the FaxSav net work utilizes the highest encryption legally allowed, ensuring that your documents stay secure. You get the benefits of carefree faxing with savings associated with the use of the internet. It is simple, quick, and secure.

### **Plain Paper Facsimile Machine**

- **15 second transmission speed \***
- **Letter/Legal, G3 compatible**
- **Automatic document feeder (15 sheets)**
- **6 stations one-touch dialer**
- **Broadcast (up to 20 station) × 3**
- **Resolution : Standard/Fine/Super fine/Half tone (64 level)**
- **LCD Contrast : Normal/Darker**
- **Delayed transmission**
- **Overseas transmission function**
- **Remote FAX receiving using an extension phone**
- **150-sheet paper capacity**
- **Automatic fax/phone switching**
- **Distinctive ring detection \*\***
- **Caller ID**

\* The 15 second speed is based upon the CCITT No. 1 Test Chart on the condition that memory

transmission is performed.

**\*\* Subscription to distinctive ring services required.**

**Large Memory (28 pages) Performed by DRAM**

**Approx. 28 pages of memory reception**

**Approx. 25 pages of memory transmission**

**Integrated Telephone System**

**- On-hook dialing**

**- Monitor**

**- Voice muting**

**- Redialing function**

**- 100-Station telephone directory with Jog Dial**

**Copier function**

**- Multi-copy function (up to 99 copies)**

**- Enlargement and reduction**

**- Collate**

**- 64-Level halftone**

**- Electronic film indicator**

## **1.9. SPECIFICATIONS**

[These specifications are for the U.S.A. version only. Refer to the simplified manual (cover) for other areas.]

**Applicable Lines:**

**Public Switched Telephone Network**

**Document Size:**

**Max. 216 mm (8 1/2") in width**

**Max. 600 mm (23 5/8") in length**

**Effective Scanning Width:**

**208 mm (8 3/16")**

**Recording Paper Size:**

**Letter: 216×279 mm (8 1/2"×11")**

**Legal: 216×356 mm (8 1/2"×14")**

**Effective Printing Width:**

**208 mm (8 3/16")**

**Transmission Time\*:**

**Approx. 15 sec./page (Original mode)\*\***

**Scanning Density:**

**Horizontal:**

**8 pels/mm (203 pels/inch)**

**Vertical:**

**3.85 lines/mm (98 lines/inch)—STANDARD mode**

**7.7 lines/mm (196 lines/inch)—FINE/HALF TONE mode**

**15.4 lines/mm (392 lines/inch)—SUPER FINE Mode**

**Halftone Level:**

**64-level**

**Scanner Type:**

**Contact Image Sensor (CIS)**

**Printer Type:**

**Thermal Printing**

**Data Compression System:**

**Modified Huffman (MH), Modified READ (MR)**

**Modem Speed:**

**9,600/7,200/4,800/2,400 bps; Automatic Fallback**

**Operating Environment:**

**5—35°C (41—95°F), 20—80 % RH(Relative Humidity)**

**Dimensions (H×W×D):**

**143×325×305 mm (5 5/8"×12 13/16"×12")**

**Mass (Weight):**

**Approx. 4.0 kg (8.8 lb.)**

**Power Consumption:**

**Standby: Approx. 4.0 W**

**Transmission: Approx. 18 W**

**Reception: Approx. 39 W (When receiving a 20% black document)**

**Copy: Approx. 48 W (When copying a 20% black document)**

**Maximum: Approx. 160 W (When copying a 100% black document)**

**Power Supply:**

**120 V AC, 60 Hz (This unit will not function at 50 Hz.)**

**Memory Capacity:**

**Approx. 28 pages memory reception**

**Approx. 25 pages memory transmission**

**(Based on CCITT No. 1 Test Chart in standard resolution.)**

\* Transmission speed depends upon the contents of the pages, resolution, telephone line conditions and capability of the receiving unit.

\*\* The 15 second speed is based upon the CCITT No. 1 Test Chart and original mode. (Refer to "1.11. CCITT No. 1 Test Chart".) If the capability of the other party's machine is inferior to your unit, the transmission time may be longer.

Note:

- Any details given in these instructions are subject to change without notice.
- The pictures and illustrations in these instructions may vary slightly from the actual product.

Design and specifications are subject to change without notice.

## **1.10. OPTIONAL ACCESSORIES**

Model No.	Description	Specifications
KX-FA65	Film cartridge	216 mm x 100 m (8½" x 328') roll
PFZXFP101M	Paper stacker	Used to stack printed paper.

## **1.11. CCITT No. 1 Test Chart (Actual size)**

## THE SLEREXE COMPANY LIMITED

SAPORS LANE - BOOLE - DORSET - BH 25 8 ER

TELEPHONE BOOLE (945 13) 51617 - TELEX 123456

Our Ref. 350/PJC/EAC

18th January, 1972.

Dr. P.N. Cundall,  
Mining Surveys Ltd.,  
Holroyd Road,  
Reading,  
Berks.

Dear Pete,

Permit me to introduce you to the facility of facsimile transmission.

In facsimile a photocell is caused to perform a raster scan over the subject copy. The variations of print density on the document cause the photocell to generate an analogous electrical video signal. This signal is used to modulate a carrier, which is transmitted to a remote destination over a radio or cable communications link.

At the remote terminal, demodulation reconstructs the video signal, which is used to modulate the density of print produced by a printing device. This device is scanning in a raster scan synchronised with that at the transmitting terminal. As a result, a facsimile copy of the subject document is produced.

Probably you have uses for this facility in your organisation.

Yours sincerely,

P.J. CROSS  
Group Leader - Facsimile Research

Registered in England: No. 2038  
Registered Office: 60 Vicars Lane, Ilford, Essex.

## 1.12. LOCATION OF CONTROLS

### 1.12.1. OVERVIEW

**Note:**

- The document and recording paper will be ejected from the front of the unit. Do not put anything in front of the unit.

### **1.12.2. CONTROL PANEL**

## 1.13. CONNECTIONS

[This connection is for the U.S.A. version only. Refer to the simplified manual (cover) for other areas.]

## 1.14. INSTALLATION

### 1.14.1. INSTALLATION SPACE

The space required to install the unit is shown below.

The dimensions given are necessary for the unit to operate efficiently.

**Note:**

- **Avoid excessive heat or humidity.**
- **Use the unit within the following ranges of temperature and humidity.**
- **Ambient temperature: 5°C to 35°C**
- **Relative humidity: 20% to 80% (without condensation)**
- **Power cord length should be less than 5 meters (16.4 feet). Using a longer cord may reduce the voltage or cause malfunctions.**
- **Avoid direct sunlight.**
- **Do not install near devices which contain magnets or generate magnetic fields.**
- **Do not subject the unit to strong physical shock or vibration.**
- **Keep the unit clean. Dust accumulation can prevent the unit from functioning properly.**
- **To protect the unit from damage, hold both sides when you move it.**

#### **1.14.2. INSTALLING THE PAPER STACKER**

(Refer to 1.10. OPERATIONAL ACCESSORIES.)

#### **1.14.3. USING LEGAL SIZE PAPER**

#### **1.14.4. INSTALLING THE PAPER TRAY**

#### **1.14.5. INSTALLING THE RECORDING PAPER**

**Note:**

- **Avoid paper with a cotton and/or fiber content that is over 20%, such as letterhead paper or those used for resumes.**
- **Do not use different types or thicknesses of paper in the cassette at the same time. This may cause a paper jam.**
- **Avoid extremely smooth or shiny paper that is highly textured. Also avoid paper that is coated, damaged or wrinkled.**
- **Avoid double-sided printing.**
- **Do not use paper printed from this unit for double-sided printing with other copiers or printers, or the paper may jam.**

#### 1.14.6. ADDING PAPER TO THE PAPER TRAY

#### 1.14.7. DOCUMENTS THE UNIT CAN FEED

#### 1.14.8. SETTING YOUR LOGO

#### 1.14.9. TO SELECT CHARACTERS WITH THE DIAL KEYPAD

Pressing the dial keys will select a character as shown below.

Keys		Characters
Dial keys	①	1 [ ] { } + - / = , . _ ` : ; ?
	②	A B C a b c 2
	③	D E F d e f 3
	④	G H I g h i 4
	⑤	J K L j k l 5
	⑥	M N O m n o 6
	⑦	P Q R S p q r s 7
	⑧	T U V t u v 8
	⑨	W X Y Z w x y z 9
	⑩	0 ( ) < > ! " # \$ % & ¥ * @ ^ ' →
One-Touch Dial keys		<b>HYPHEN</b> key (Used to insert a hyphen.)
		<b>INSERT</b> key (Used to insert one character or one space.)
Arrow keys		◀ key (Used to move the cursor to the left.)
		▶ key (Used to move the cursor to the right.) To enter another character using the same number key, move the cursor to the next space.

**Note: A hyphen entered in a telephone number is counted as two digits.**

#### 1.14.10. TO SELECT CHARACTERS USING THE JOG DIAL

#### 1.14.11. REPLACING THE FILM CARTRIDGE

### 1.15. MAINTENANCE ITEMS AND COMPONENT LOCATIONS

### **1.15.1. OUTLINE**

**MAINTENANCE AND REPAIRS ARE PERFORMED USING THE FOLLOWING STEPS.**

#### **1. Periodic maintenance**

**Inspect the equipment periodically and if necessary, clean any contaminated parts.**

#### **2. Check for breakdowns**

**Look for problems and consider how they arose.**

**If the equipment can be still used, perform copying, self testing or communication testing.**

#### **3. Check equipment**

**Perform copying, self testing and communication testing to determine if the problem originates from the transmitter, receiver or the telephone line.**

#### **4. Determine causes**

**Determine the causes of the equipment problem by troubleshooting.**

#### **5. Equipment repairs**

**Repair or replace the defective parts and take appropriate measures at this stage to ensure that the problem will not recur.**

#### **6. Confirm normal operation of the equipment**

**After completing the repairs, conduct copying, self testing and communication testing to confirm that the equipment operates normally.**

#### **7. Record keeping**

**Make a record of the measures taken to rectify the problem for future reference.**

### **1.15.2. MAINTENANCE CHECK ITEMS/COMPONENT LOCATIONS**

#### **1.15.2.1. MAINTENANCE LIST**

NO.	OPERATION	CHECK	REMARKS
1	Document Path	Remove any foreign matter such as paper.	—
2	Rollers	If the roller is dirty, clean it with a damp cloth then dry thoroughly.	Refer to 1.15.2. MAINTENANCE
3	Platen Roller	If the platen is dirty, clean it with a damp cloth then dry thoroughly. Remove the paper and film cartridge before cleaning.	—
4	Thermal Head	If the thermal head is dirty, clean the printing surface with a cloth moistened with denatured alcohol (alcohol without water), then dry thoroughly.	Refer to 1.15.2. MAINTENANCE
5	Sensors	Document sensor (PI302), Read position sensor (PI301), Hook switch (SW401), Paper top sensor (PI402), Film end sensor (PI403), Cover open sensor (PI303) and Paper set switch (SW101). Confirm the operation of the sensors.	See 1.15.3. MAINTENANCE 4. DISASSEMBLY INSTRUCTIONS
6	Glass, White Plate	If the glass and the white plate are dirty, clean them with a dry soft cloth.	Refer to 1.15.2. MAINTENANCE CHECK ITEM/ COMPONENT LOCATIONS
7	Mirrors and Lens	If the mirrors and lens are dirty, clean them with a soft dry cloth.	—
8	Abnormal, wear and tear or loose parts	Replace the part. Check if the screws are tight on all parts.	—

#### 1.15.2.2. MAINTENANCE CYCLE

No.	Item	Cleaning Cycle	Replacement	
			Cycle	Procedure
1	Separation Roller (Ref. No. 173)	3 months	7 years* (100,000 documents)	Refer to 4. DISASSEMBLY INSTRUCTIONS.
2	Separation Rubber (Ref. No. 44)	3 months	7 years (100,000 documents)	Refer to 1.15.2. MAINTENANCE CHECK ITEM/ COMPONENT LOCATIONS.
3	Feed Rollers (Ref. No. 109)	3 months	7 years (100,000 documents)	Refer to 4. DISASSEMBLY INSTRUCTIONS.
4	Thermal Head (Ref. No. 51)	3 months	7 years (100,000 documents)	Refer to 4. DISASSEMBLY INSTRUCTIONS.
5	Platen Roller (Ref. No. 102)	3 months	7 years (100,000 documents)	Refer to 4. DISASSEMBLY INSTRUCTIONS.

No.	Item	Cleaning Cycle	Replacement	
			Cycle	Procedure
6	Pickup Roller (Ref. No. 134)	3 months	7 years (100,000 documents)	Refer to 4. DISASSEMBLY INSTRUCTIONS.

### 1.15.3. MAINTENANCE

#### 1.15.3.1. CLEANING THE DOCUMENT FEEDER UNIT

#### 1.15.3.2. CLEANING THE THERMAL HEAD AND BLACK BAR

#### 1.15.3.3. CLEANING THE PICKUP ROLLER

If misfeeding occurs frequently or if spots or black bands appear on a copied or received paper, clean the Pickup roller.

## 2. TROUBLESHOOTING GUIDE

### 2.1. TROUBLESHOOTING SUMMARY

#### 2.1.1. TROUBLESHOOTING

After confirming the problem by asking the user, troubleshoot according to the instructions and observe the following precautions.

#### 2.1.2. PRECAUTIONS

1. If there is a problem with the print quality or the paper feed, first check if the installation space and the print paper meets the specifications, the paper selection lever/paper thickness lever is set correctly, and the paper is set correctly without any slack.
2. Before troubleshooting, first check that the connectors and cables are connected correctly (not loose).  
If the problem occurs randomly, check it very carefully.
3. When connecting the AC power cord with the unit and checking the operation, exercise utmost care when handling electric parts in order to avoid electric shocks and short-circuits.
4. After troubleshooting, double check that you have not forgotten any connectors, left any loose screws, etc.
5. Always test to verify that the unit is working normally.

#### 2.1.3. WHEN YOU DON'T KNOW HOW TO OPERATE THE UNIT, USE THE HELP FUNCTION

• How to use:

1. Press **[HELP]**.
2. Press **[▲]** or **[▼]** until the desired item is displayed.
3. Press **[START/SET/COPY]**.

## 2.2. USER RECOVERABLE ERRORS

If the unit detects a problem, one or more of the following messages will appear on the display.

**Note:**

The explanations given in the [ ] are for servicemen only.

### 2.2.1. PAPER JAM

### 2.2.2. RECORDING PAPER JAMS

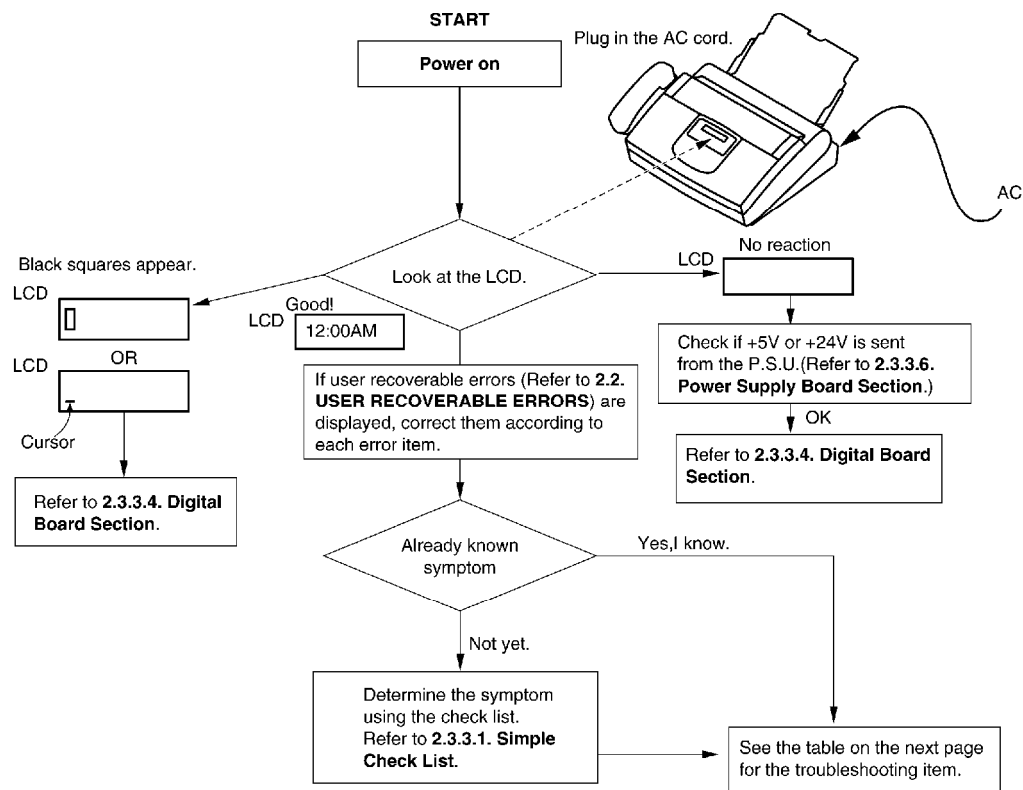

## 2.3. TROUBLESHOOTING DETAILS

### 2.3.1. OUTLINE

Troubleshooting is for recovering quality and reliability by determining the broken component and replacing, adjusting or cleaning it as required. First, determine the problem then decide the troubleshooting method. If you have difficulty finding the broken part, determine which board is broken. (For example: the Digital PCB, Analog PCB, etc.) The claim tag from a customer or dealer may use different expressions for the same problem, as they are not a technician or engineer. Using your experience, test the problem area corresponding to the claim. Also, returns from a customer or dealer often have a claim tag. For these cases as well, you need to determine the problem. Test the unit using the simple check list on 2.3.3.1. Simple Check List. Difficult problems may be hard to determine, so repeated testing is necessary.

### 2.3.2. STARTING TROUBLESHOOTING

Determine the symptom and the troubleshooting method.

### 2.3.3. TROUBLESHOOTING ITEMS TABLE

ITEM	SYMPTOM	REFERENCE
ADF (Auto Document Feeder)	The document does not feed. Document jam Multiple feed Skew	See 2.3.3.2. <b>ADF (Auto document feed) Section.</b>
Recording paper feed	The recording paper does not feed. Paper jam Multiple feed and skew	See 2.3.3.2. <b>ADF (Auto document feed) Section.</b>
Printing	The sent fax data is skewed. The received fax data is skewed. The received or copied data is expanded. A blank page is copied. A blank page is received. Black or white vertical line Black or white lateral line An abnormal image is printed.	See 2.3.3.2. <b>ADF (Auto document feed) Section.</b>
Communication FAX, TEL (analog board)	Cannot communicate by fax. An error code is displayed. ----- Cannot talk. The DTMF tone doesn't work. The handset/monitor doesn't work, etc.	See 2.3.3.3. <b>Communication Section.</b> ----- See 2.3.3.5. <b>Analog Board Section.</b>
Operation panel	Keys are not accepted.	See 2.3.3.7. <b>Operation Panel Section.</b>
Sensor	If the electric circuit is the cause, the error message corresponding to the sensor will be displayed.	See 2.3.3.8. <b>Sensor Board Section.</b>

#### 2.3.3.1. Simple Check List

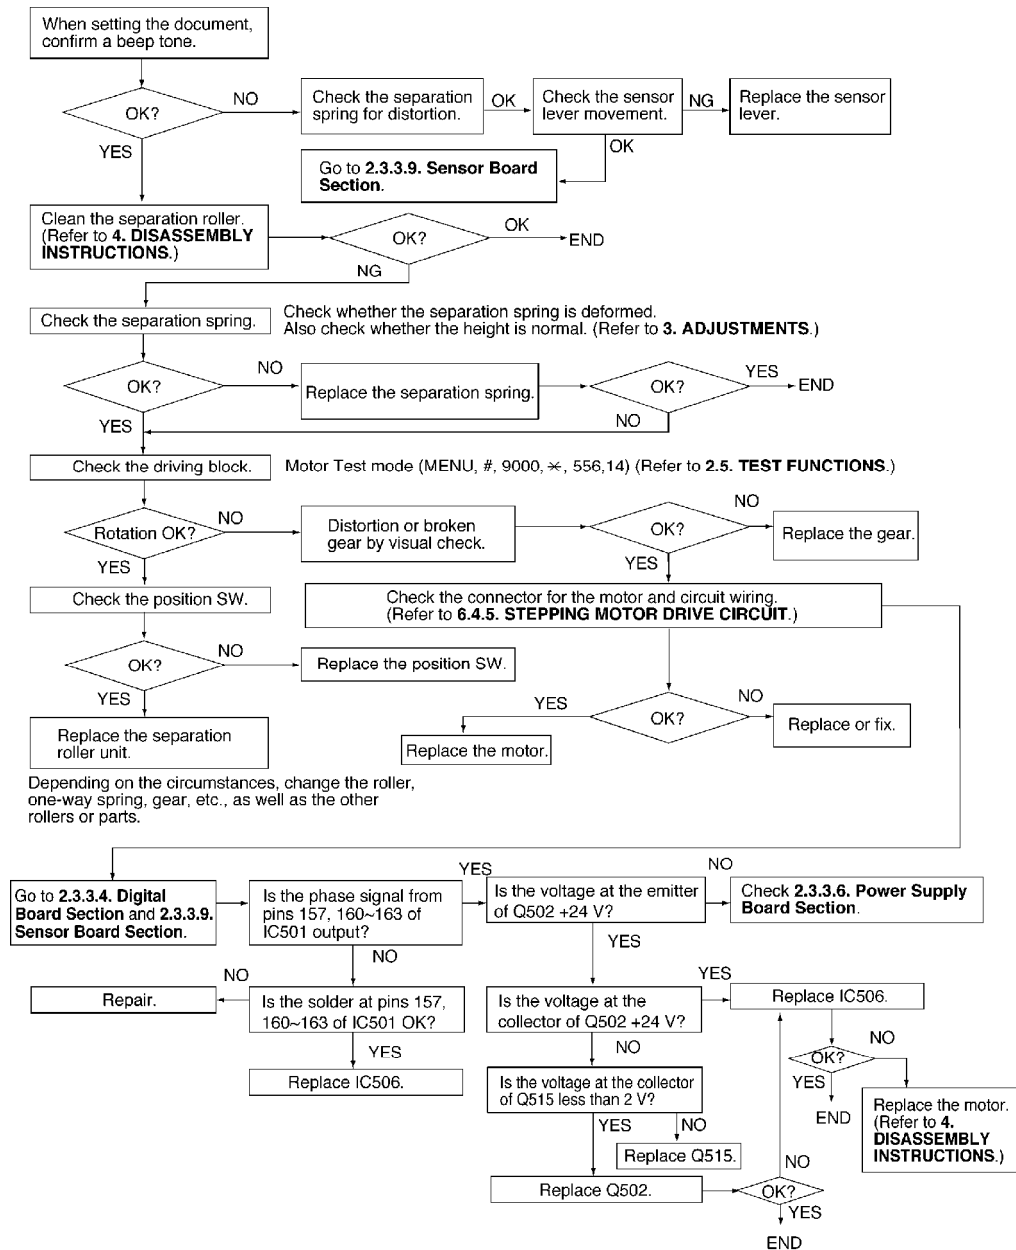

SERIAL NO.		DATE

	Remote control	OK / NG	

※Check according to the service code referring to **2.5. TEST FUNCTIONS**.

#### 2.3.3.2. ADF (Auto document feed) section

### 1. No document feed

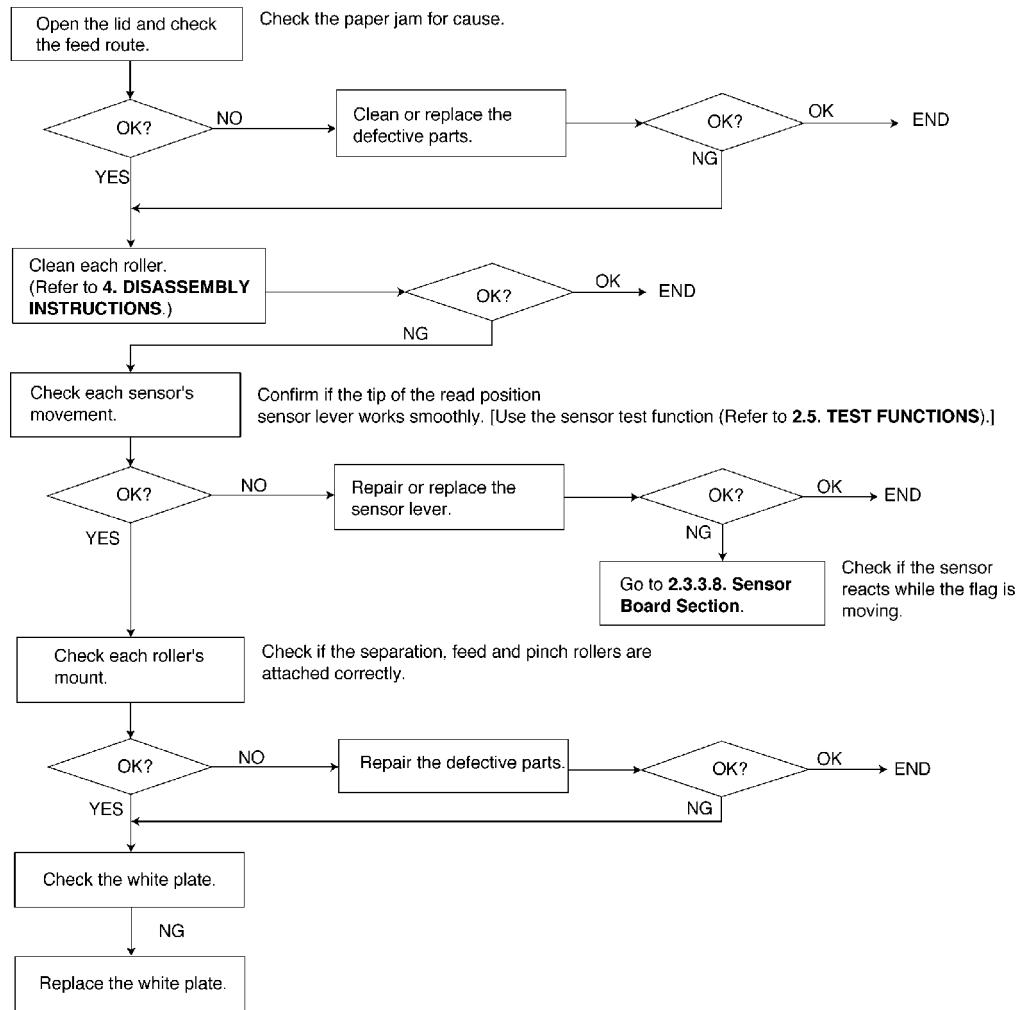

**Note:**

When using thin paper etc., sometimes the document will not feed. Refer to 3.2. ADJUSTING THE FEEDER PRESSURE.

## 2. Document JAM

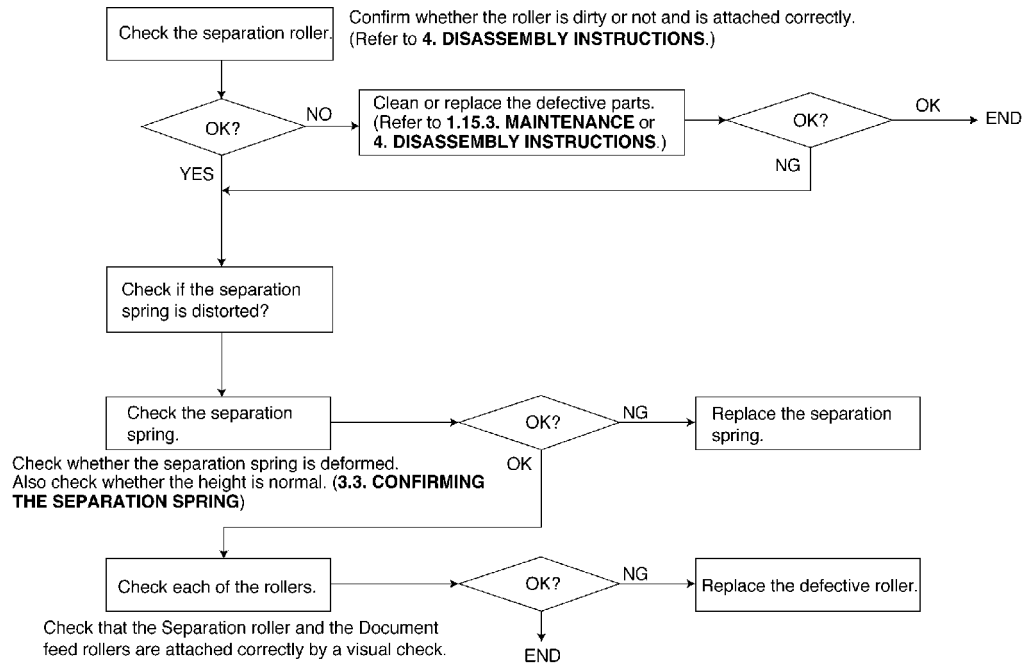

### 3. Multiple feed

- When using thick paper etc., sometimes the document will not be fed.

Refer to 3.2. ADJUSTING THE FEEDER PRESSURE.

**Fig. B**

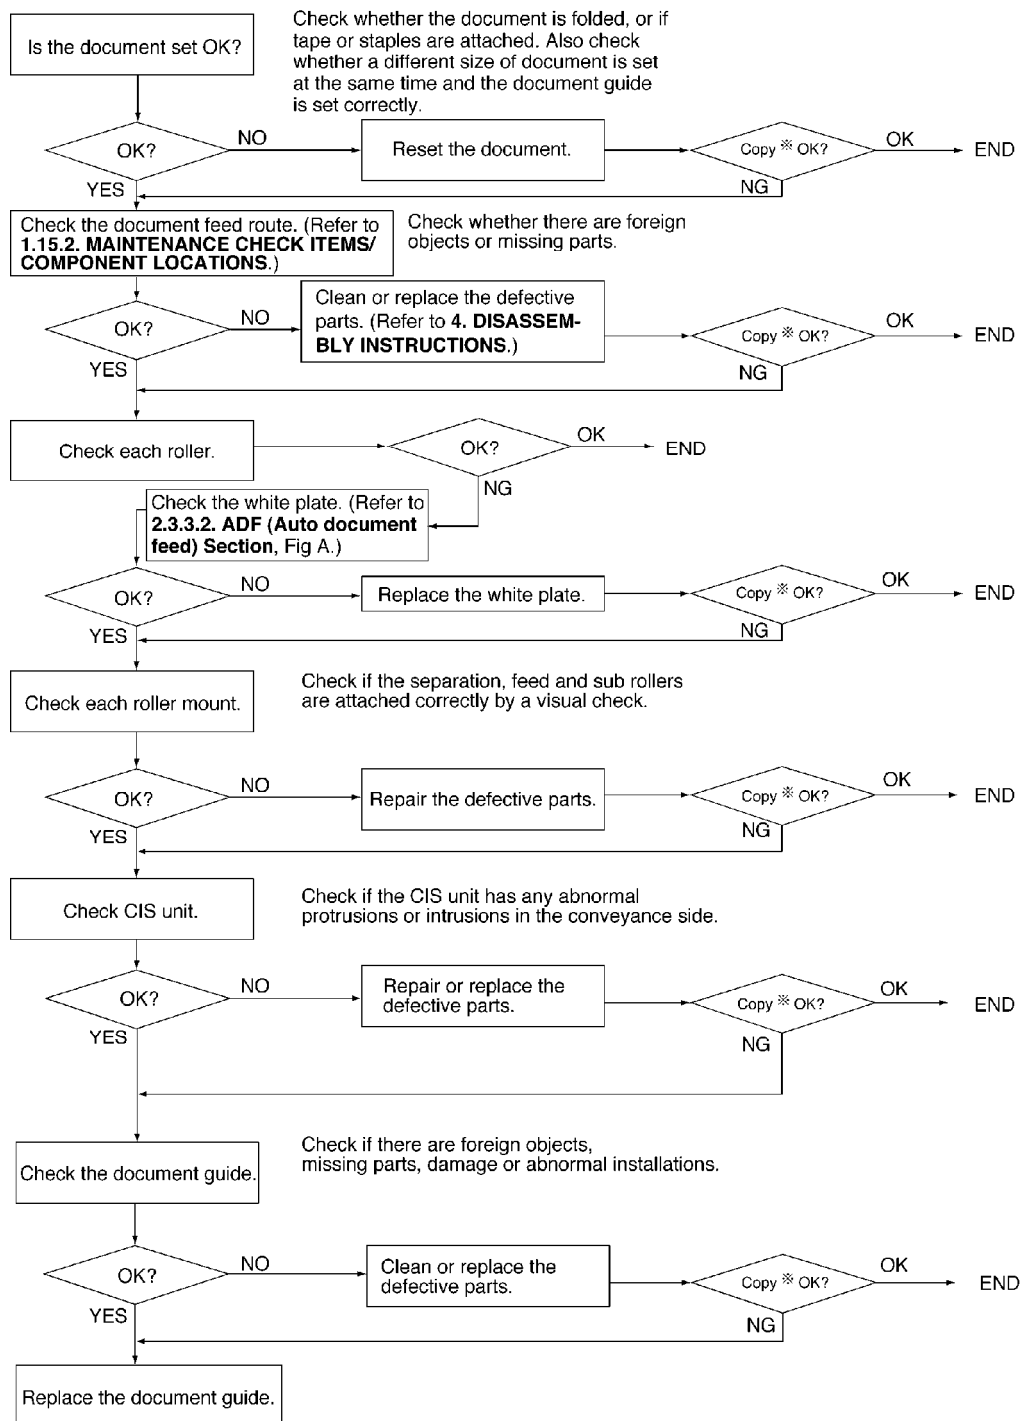

**Note:**

**When confirming if the characters are extended or distorted, or if the feed problem occurs, use this test chart format (Fig. B).**

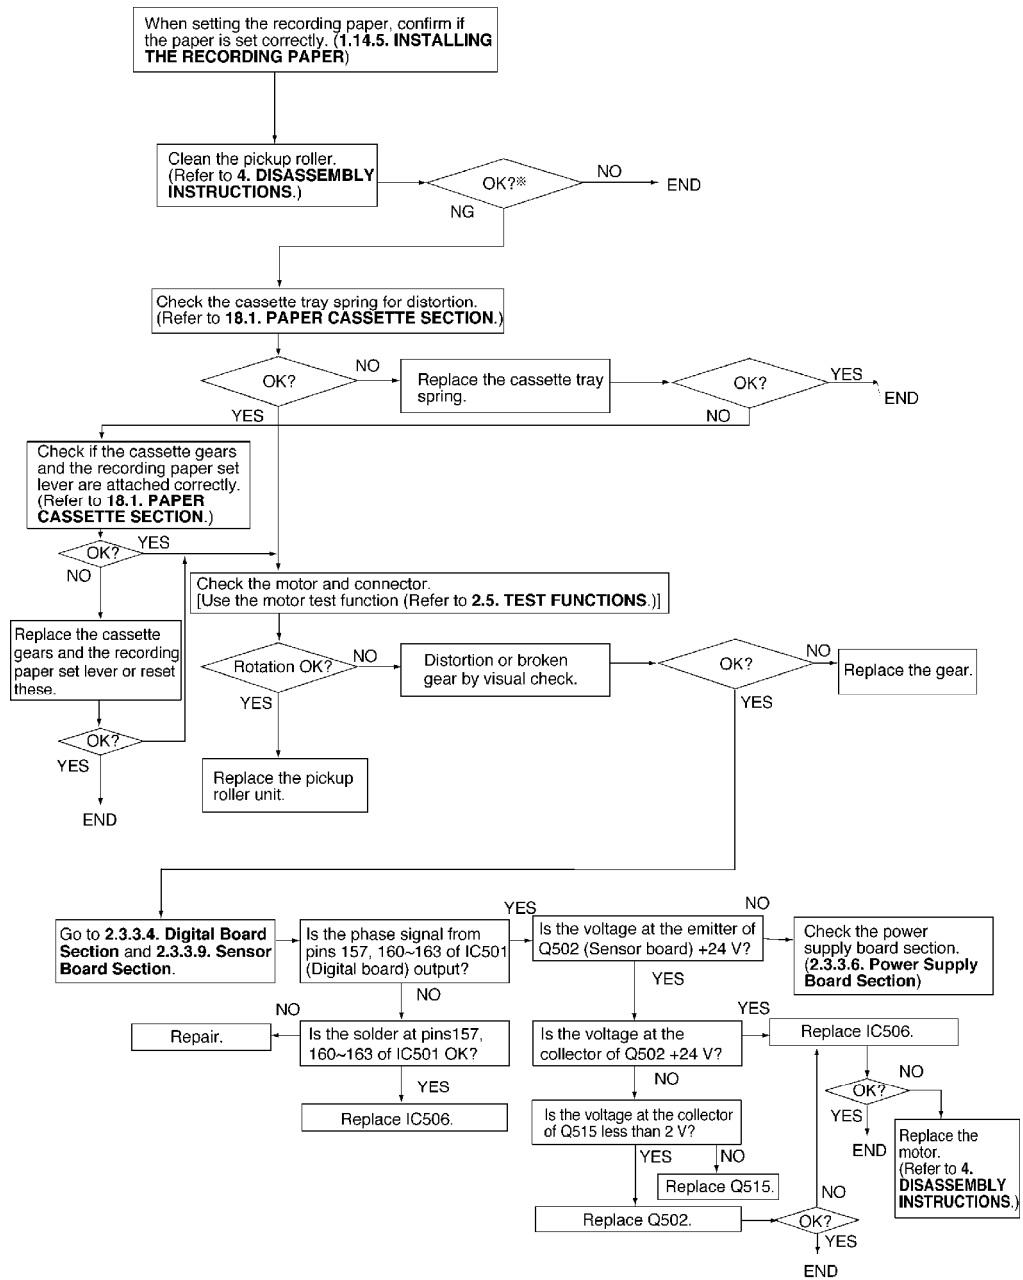

#### **4. Skew**

- ✘ We recommend making a copy of the Fig. B document in "3. Multiple feed" and using it.
5. The recording paper does not feed.

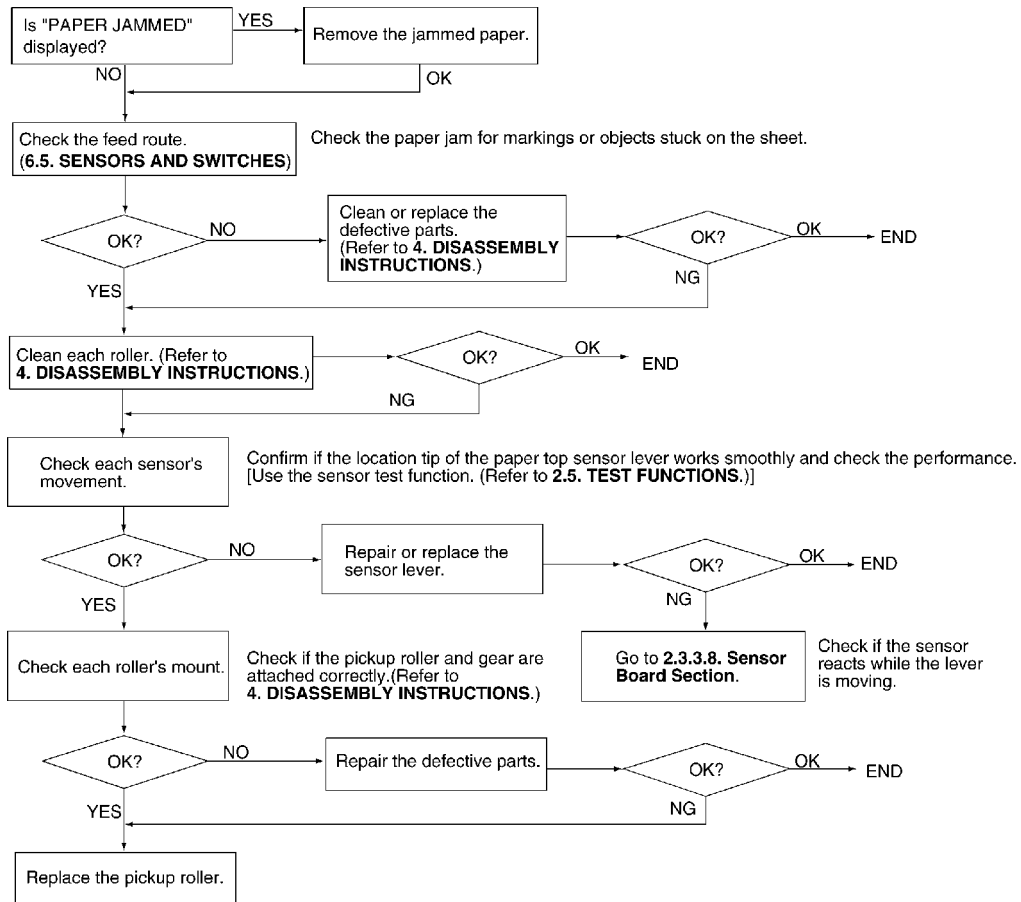

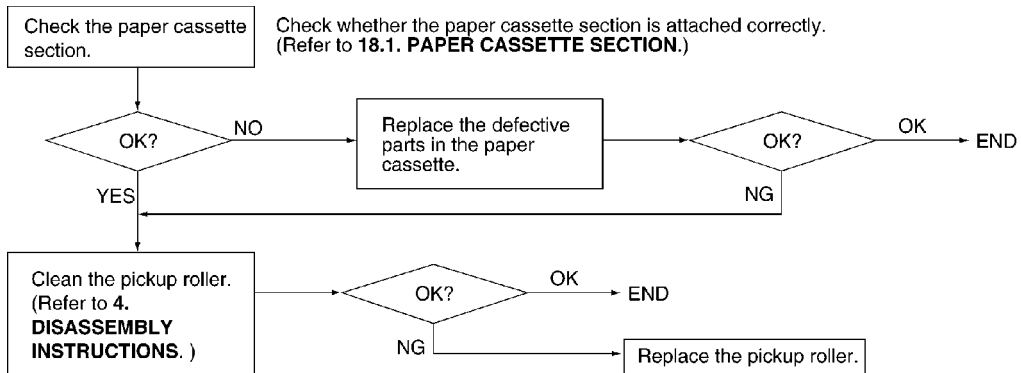

※ We recommend making a copy of the Fig. B document in "3. Multiple feed" and using it.

## 6. Paper JAM

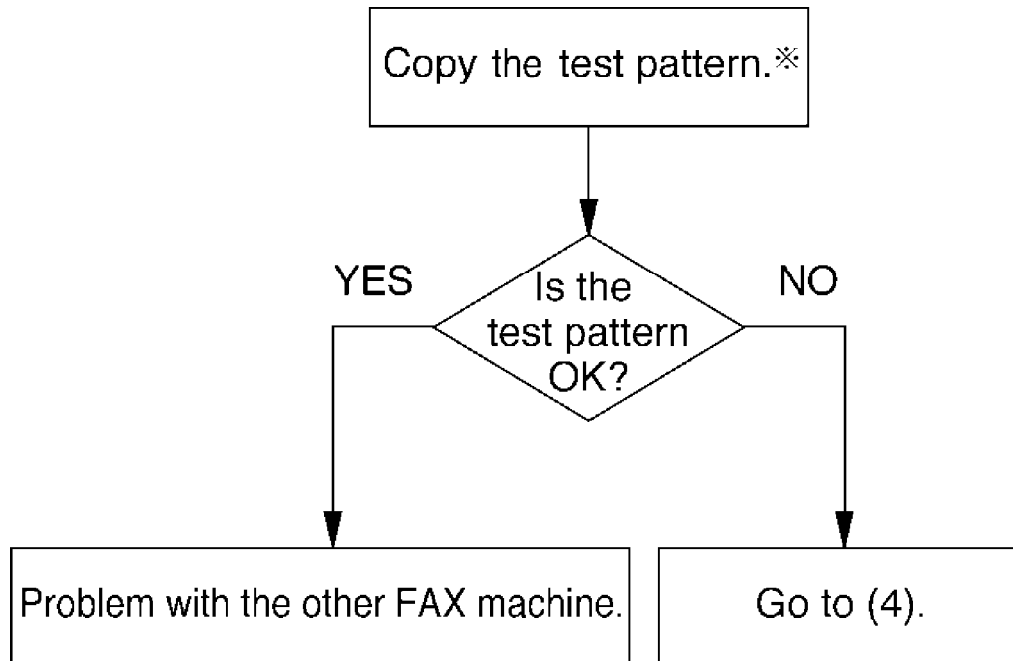

## 7. Multiple feed and skew

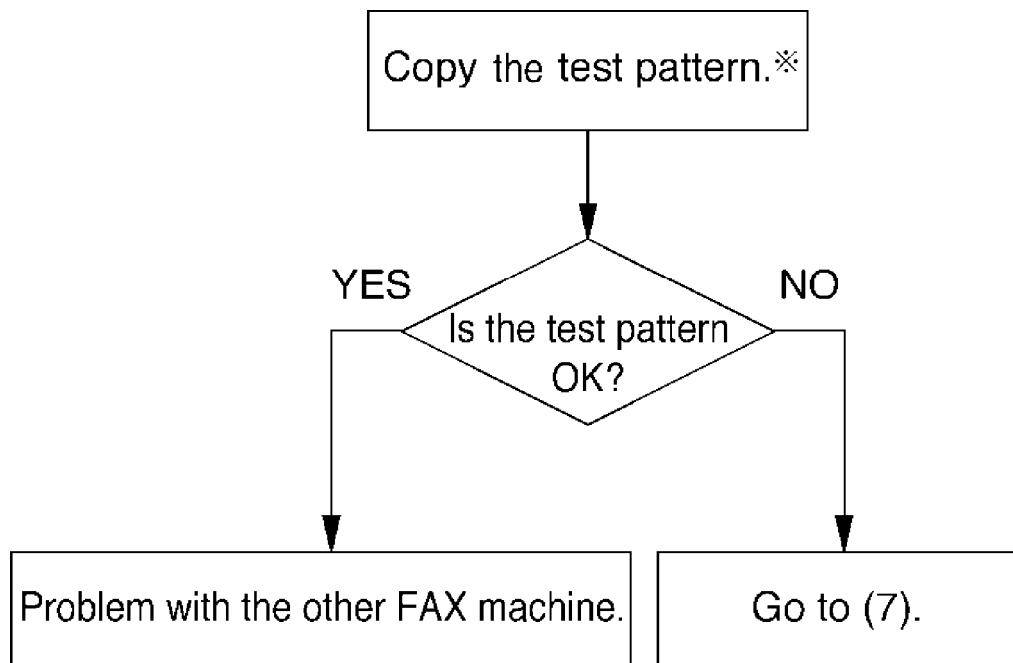

## 8. The sent fax data is skewed.

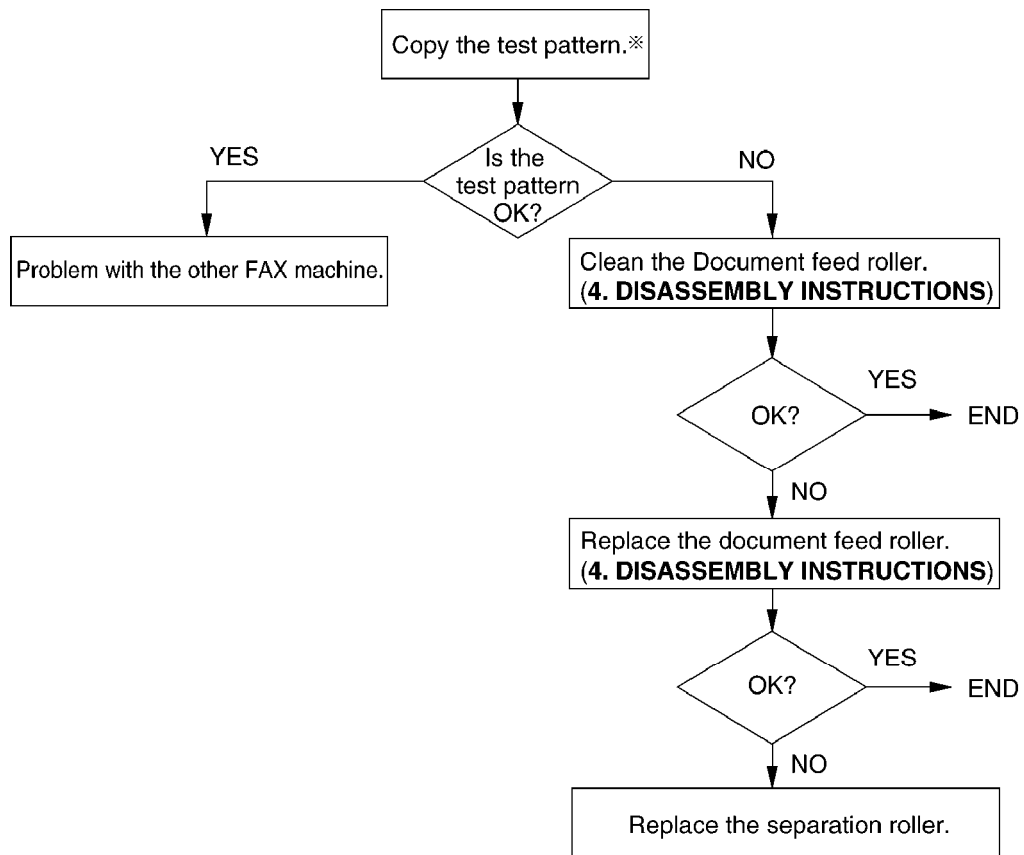

**9. The received fax data is skewed.**

**10. Received or copied data is expanded.**

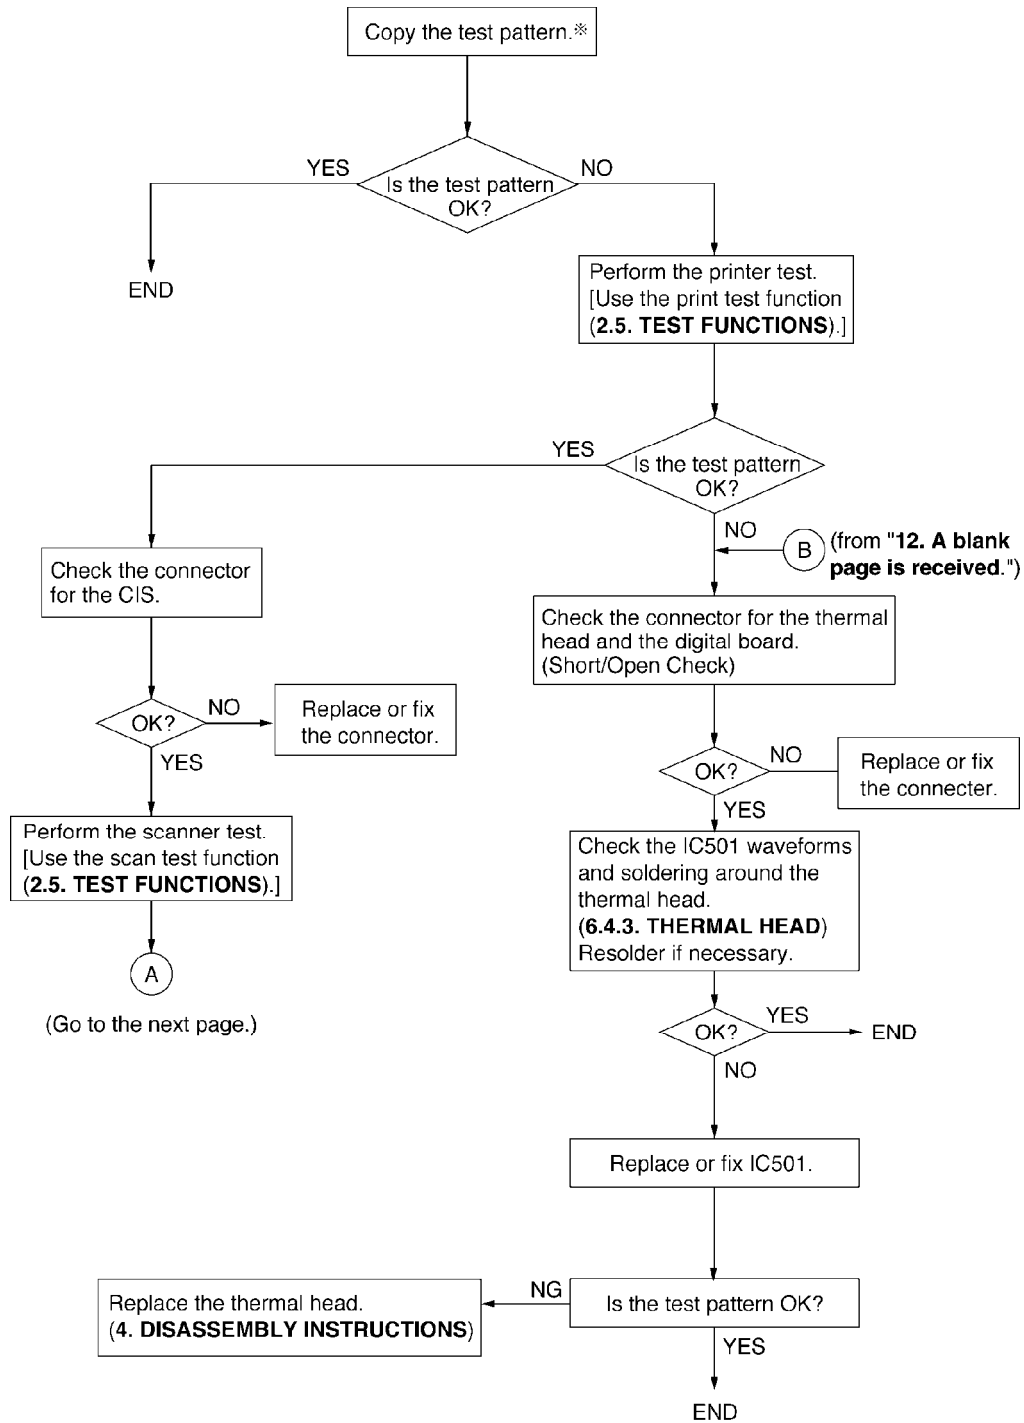

✕ We recommend making a copy of the Fig. B document in "3. Multiple feed" and using it.

11. A blank page is copied.

✱We recommend making a copy of the Fig. B document in "3. Multiple feed" and using it.

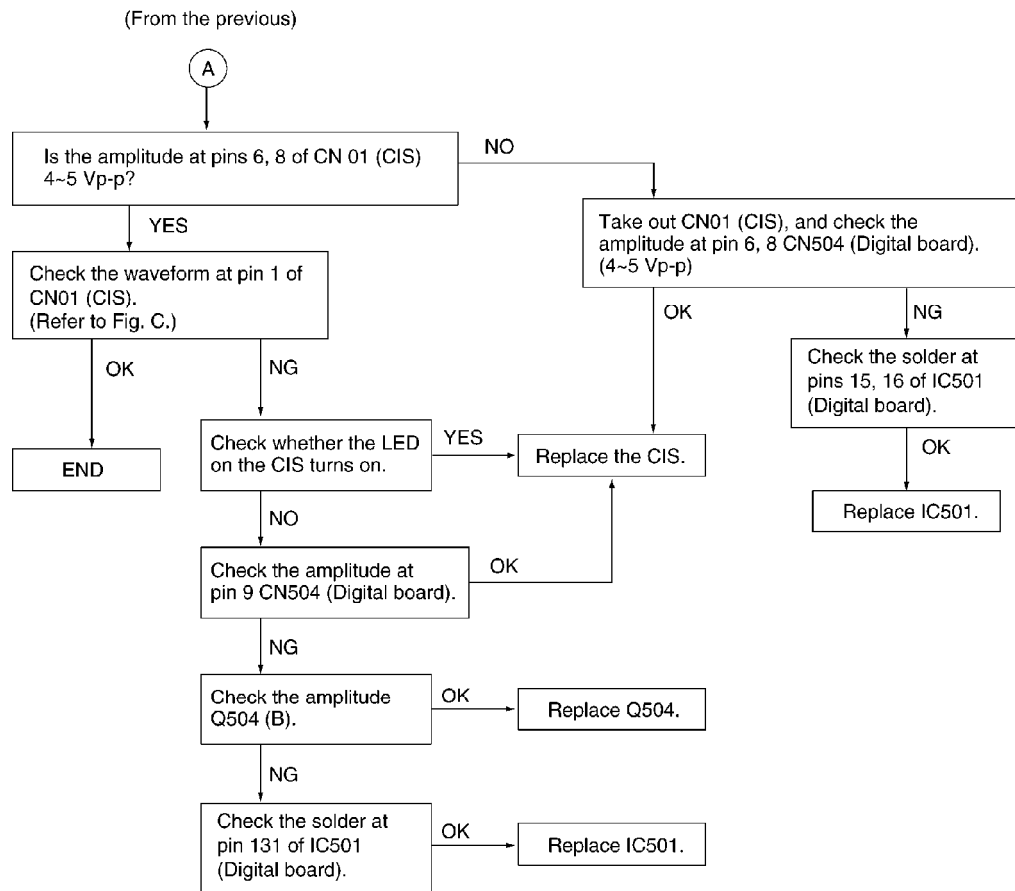

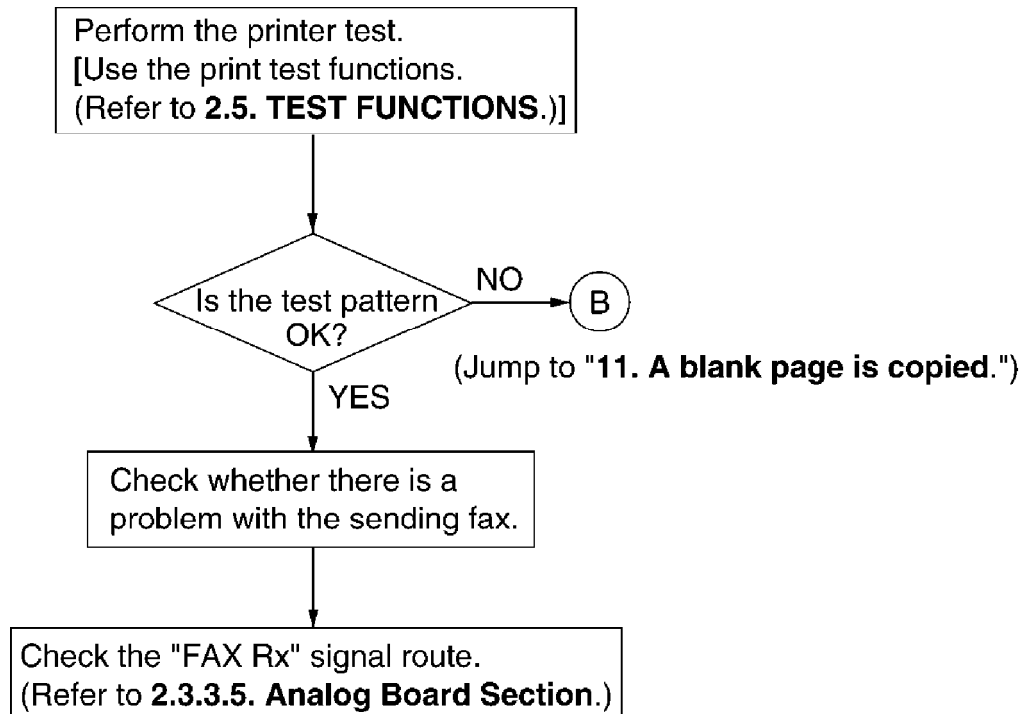

Fig. C

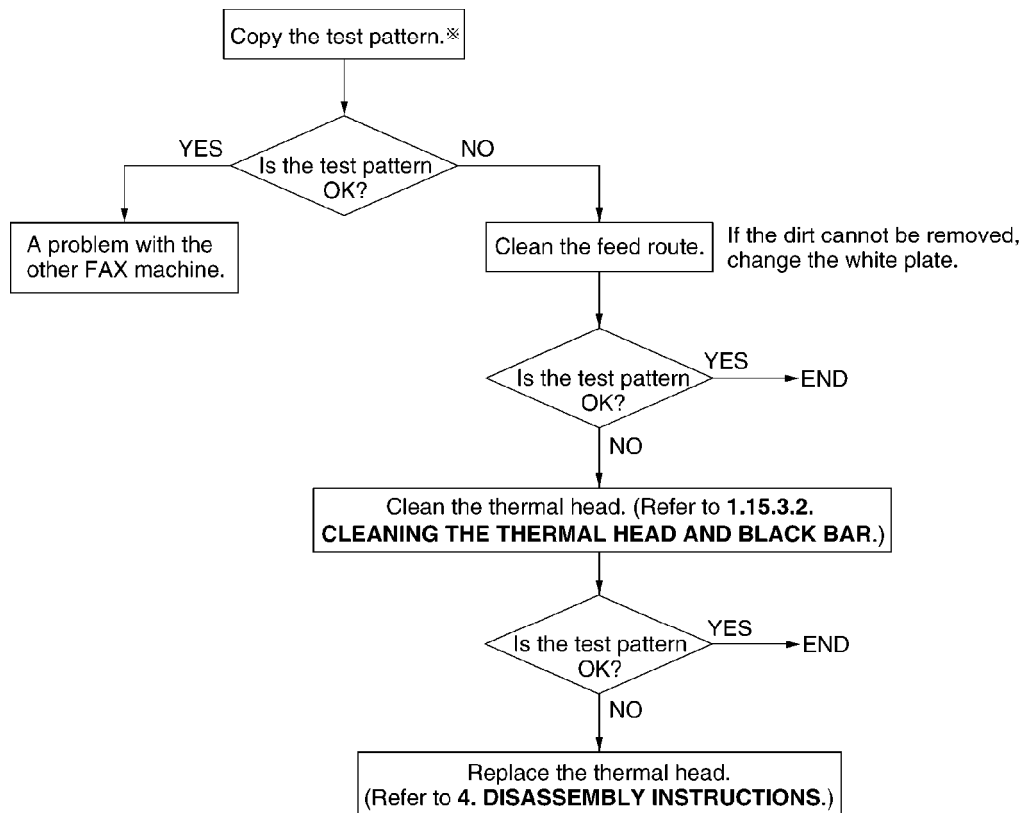

12. A blank page is received.

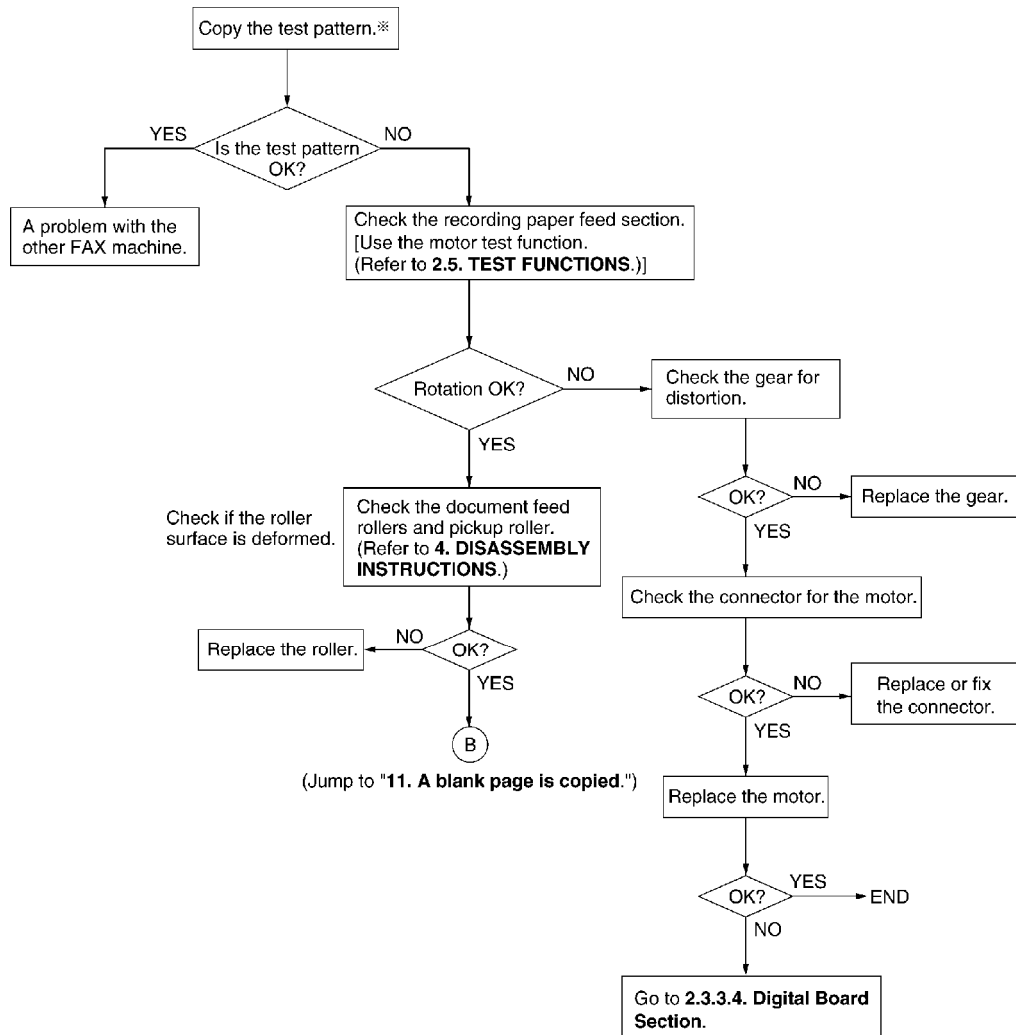

### 13. Black or white vertical line

### 14. Black or white lateral line on print out

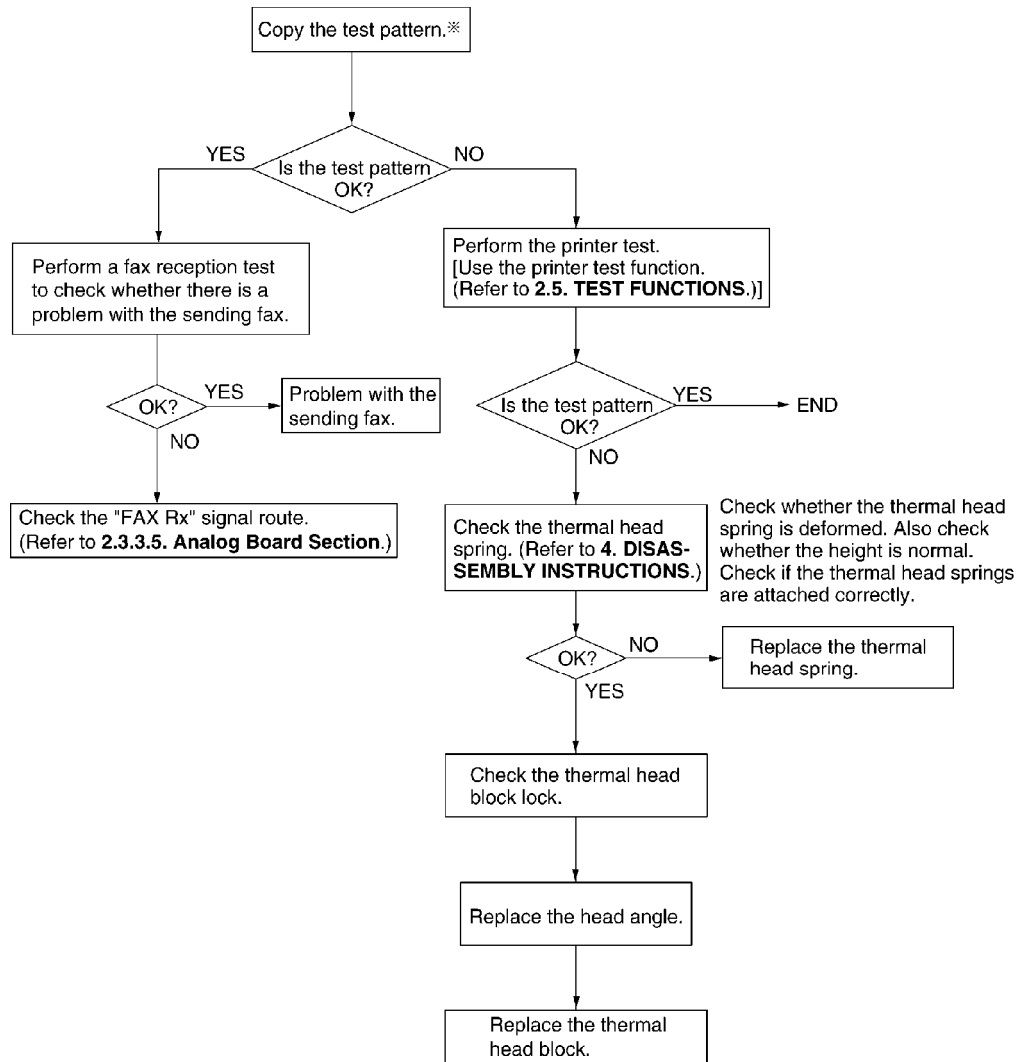

※ We recommend making a copy of the Fig. B document in "3. Multiple feed" and using it.

## 15. An abnormal image is printed.

✖ We recommend making a copy of the Fig. B document in "3. Multiple feed" and using it.

#### 2.3.3.3. Communication Section

Find the problem in the table shown below, and refer to the corresponding troubleshooting procedure in 2.3.3.3.1. Defective facsimile section.

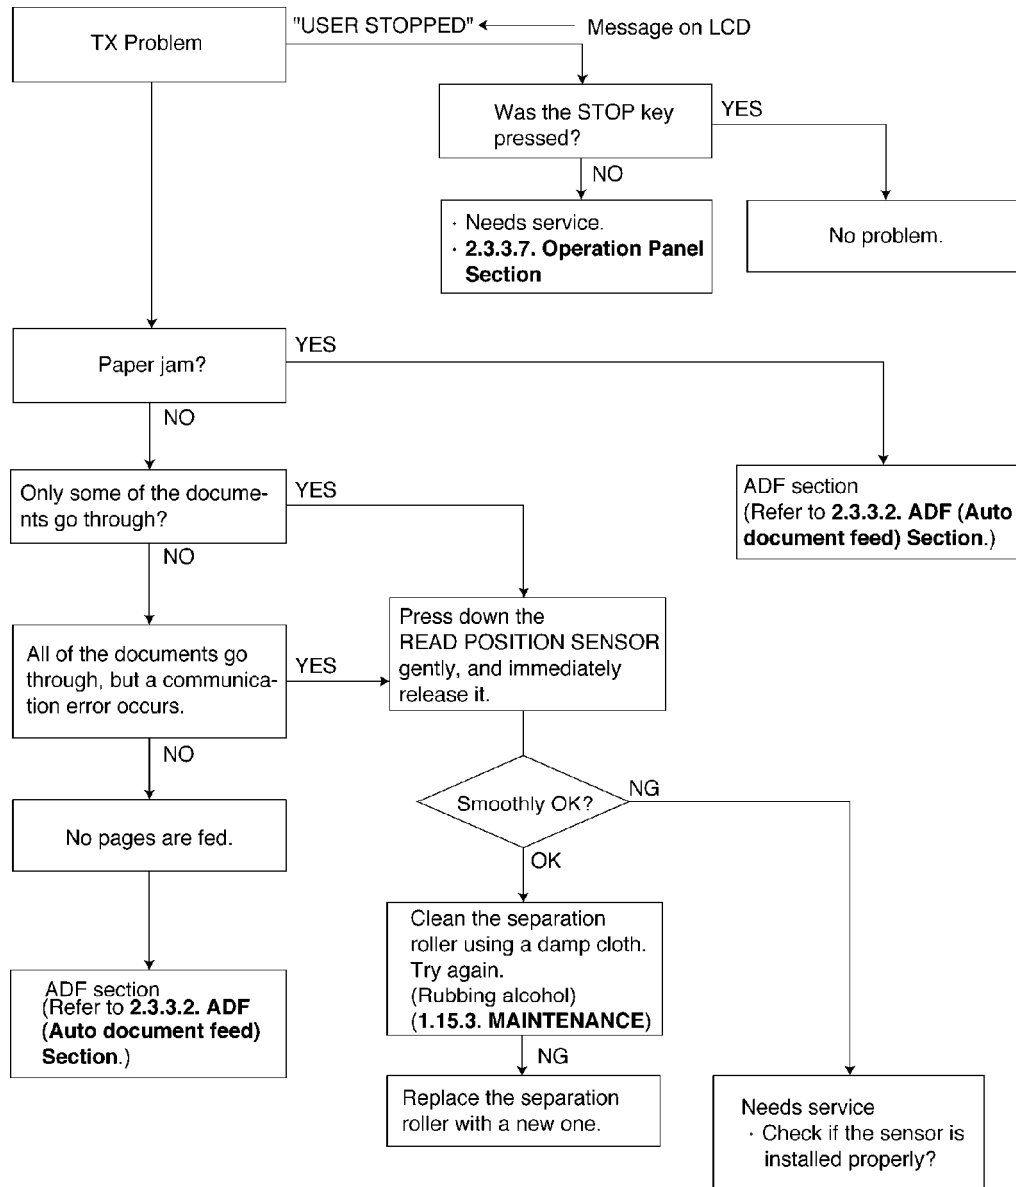

No.	Symptom	Content	Possible cause
1	The paper is not fed properly when faxing. (Nor in the copy mode.)	Troubleshooting	Problem with the feeding mechanism.
2	The fax usually transmits successfully but sometimes fails. (The unit can copy documents.)	Troubleshooting	Problem with the service line or with the receiver's fax.
3	The fax usually receives successfully but sometimes fails. (The unit can copy documents.)	Troubleshooting	Problem with the service line or with the transmitter's fax.
4	The fax completely fails to transmit or receive. (The unit can copy documents.)	Troubleshooting	Problem with the electric circuit.
5	The fax fails either to transmit or receive when making a long distance or an international call. (The unit can copy documents.)	Detailed description of the possible causes (Similar to troubleshooting items No.2 and No.3.)	Problem with the service line.
6	The fax image is poor when transmitting or receiving during a long distance or an international call.		
7	No.1-No.5	The troubleshooting procedure for each error code will be printed on the communication result report.	

#### 2.3.3.3.1. Defective facsimile section

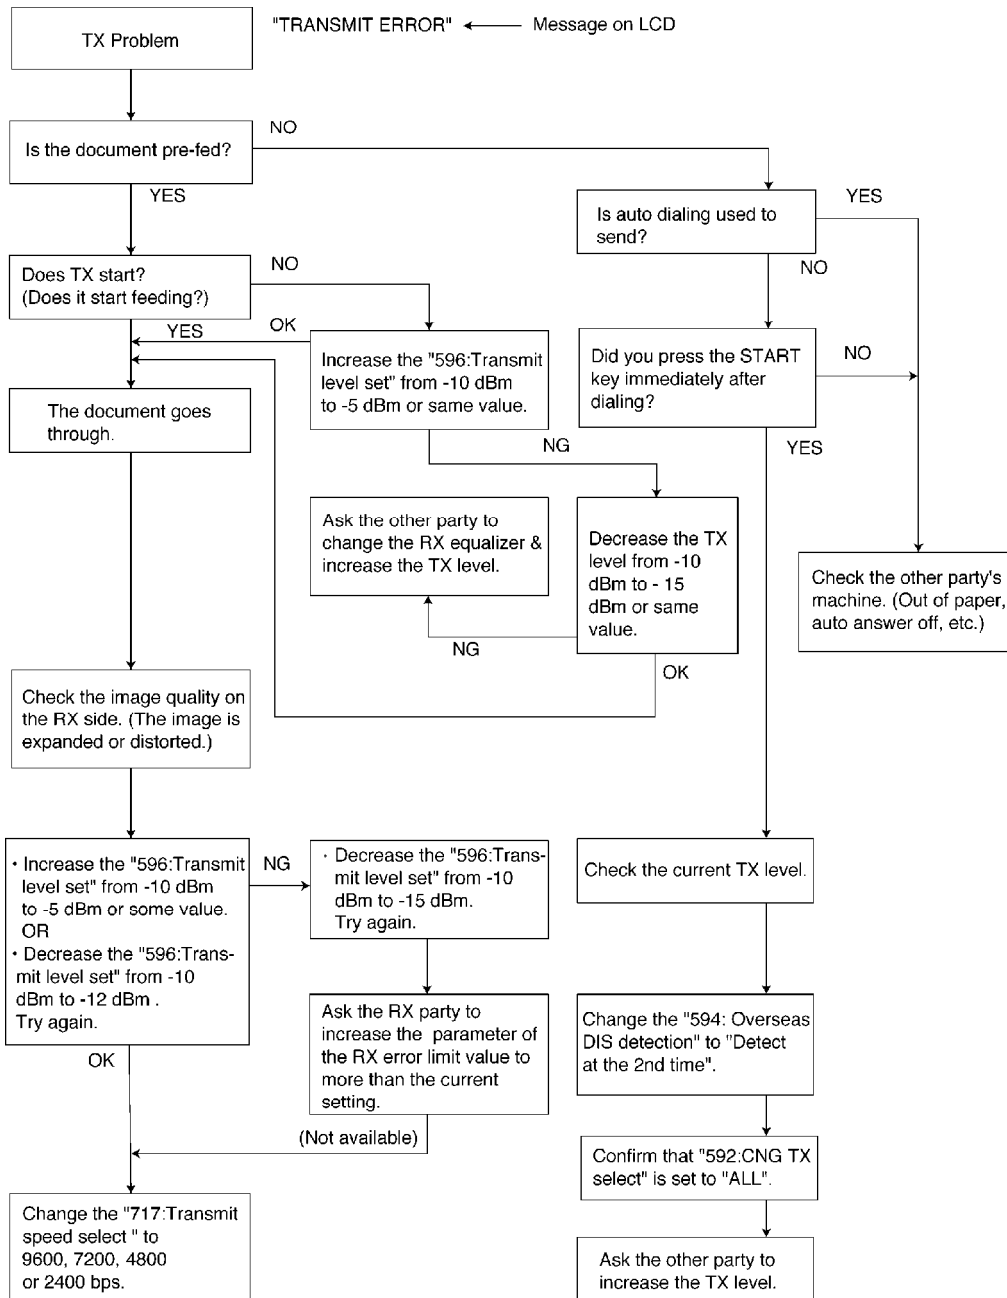

### 1. Transmit problem

## 2. Sometimes there is a transmit problem.

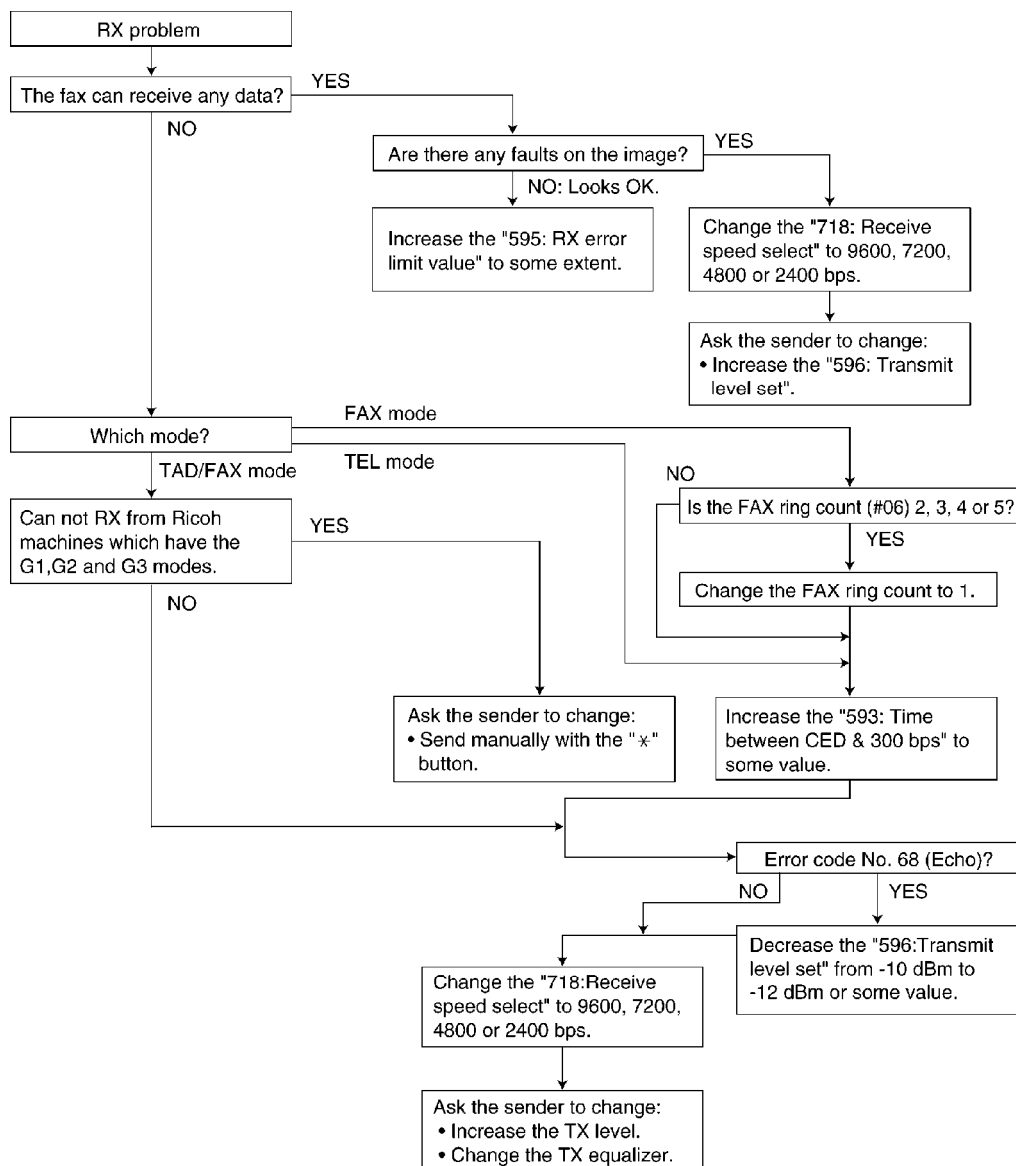

**Note:**

"596: Transmit level set" represents a service code. (Refer to 2.4.4. Service Function Table.)

### 3. Receive problem

**First confirm whether the recording paper is installed properly or not before starting troubleshooting. (Refer to "Remarks".)**

**Note:**

"596: Transmit level set" represents a service code. (Refer to 2.4.4. Service Function Table.)

**Remarks:**

Regarding the reception problem, we have investigated the conceivable causes in the flow chart except for the software-related errors. However, some troubles may occur due to the software-related problems such as "OUT OF PAPER" when the fax switches to the memory receiving mode and the memory capacity becomes full of the unprinted data. In this case, error messages [MEMORY FULL] and its main cause, for example "CHECK PAPER" are displayed on the LCD. Once you solve the main problem, [MEMORY FULL] will be cancelled and the reception problem will be resolved.

LCD display messages indicating the error causes are shown below.

CHECK PAPER  
CHECK COVER  
FILM EMPTY

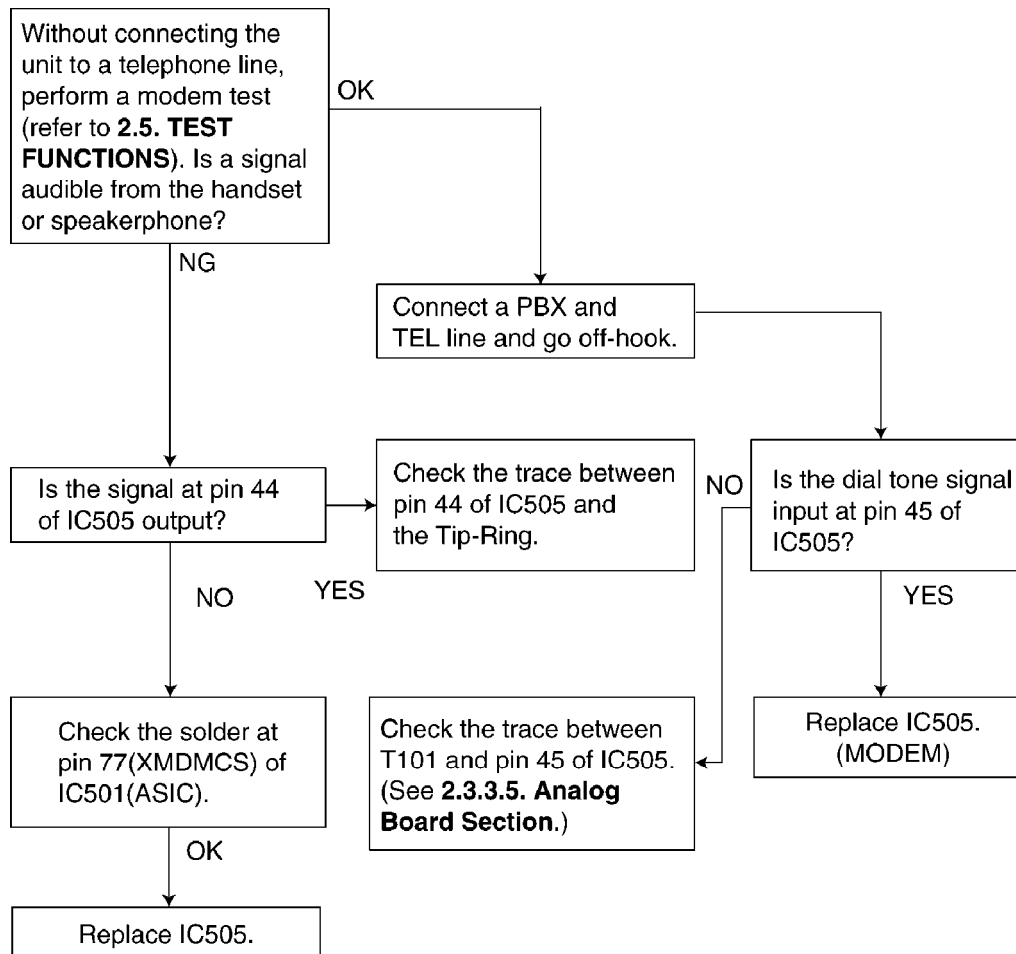

**UNIT OVERHEATED (COVER OPEN, etc.) ...Reset the unit.**

**PAPER JAMMED**

**CHECK FILM**

Please refer to 2.2. User Recoverable Errors for the above items. If it turns out to be a hardware deformity, please check each sensor. (Refer to 2.5. TEST FUNCTIONS.)

#### 4. The unit can copy, but cannot transmit/receive.

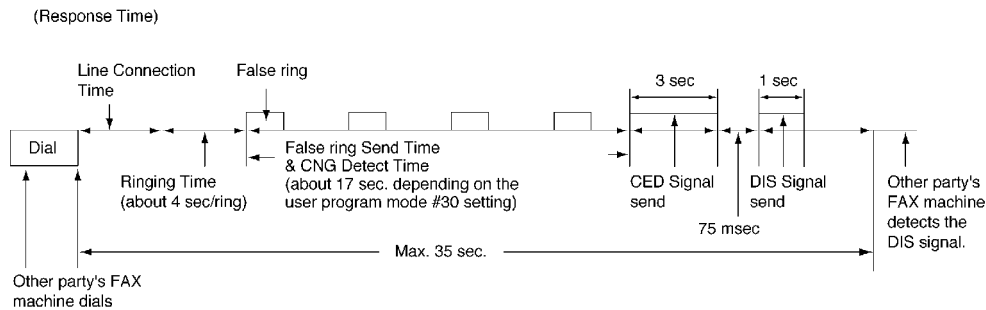

#### 5. The unit can copy, but cannot either transmit/receive long distance or international communications.

The following two causes can be considered for this symptom.

##### Cause 1:

The other party is executing automatic dialing, the call has been received by this unit, and the CED or DIS signal response time is too long. (In most cases, this unit detects the CNG signal and can respond to CED or DIS.) (According to the ITU-T standard, the communication procedure is cancelled when there is no response from the other party within 35 sec, so that the other party releases the line.)

### (Cause and Countermeasure)

As shown in the chart above, the total handshaking time must be reduced, but because of the long distance connection and linking of several stations, the line connection time cannot be reduced.

Accordingly, the following countermeasures should be tried.

(A)... As the 35 sec. count is started directly after dialing or directly after the START button has been pressed for models with a START button, the other party should be called manually, if possible.

Another possibility is entering two pauses at the end of the auto dial number on the transmission side. Then the count start time can be delayed for 2 pauses (about 10 sec.).

#### Cause 2:

Erroneous detection because of an echo or an echo canceler.

The sea bottom cable or satellite communication path (4 Line Type)

### (Echo/Echo Canceler)

The signal from FAX1 reaches FAX2 via stations 1 and 2, but the reflection signal at station 2 also returns via station 1 (echo). As the distance between station 1 and station 2 is far, the echo returns to FAX 1 at a max of 600 msec after transmission. There is a possibility that this signal is detected erroneously as the signal from FAX2. For a normal call, there is also a possibility that the echo of their own voice will make the call difficult to understand. For this reason, each station (station 1 and station 2) attaches echo cancelers (S1 and S2) for international lines or long distance

lines. For the echo canceler, the level of the transmission signal from FAX 1 is compared with the level of the reception signal from FAX2. When the transmission signal is larger, S1 is closed while S2 is opened when it is smaller. In other words, for transmission from FAX1, S1 is closed and S2 is open, so that the echo does not return to FAX1.

**(Causes and Countermeasures)**

**(Cause A)**

When a training signal is transmitted from FAX1 during the communication procedure at the time of transmission from FAX1 to FAX2, there is a delay until the echo canceler operates. S1 is closed so that a part of the head of the training signal may drop out. Normal reception by FAX2 may not be possible, and transmission may not be started.

**(Countermeasure A)**

When the international line mode is ON in the service mode (code No. 521), a dummy signal is attached to the head of the training signal to prevent this problem. As this is normally ON, it is necessary to reconfirm that this has not become OFF. When the international mode is switched OFF, the transmission side will try the training signal three times at each speed (9600BPS, 4800BPS and 2400BPS). If NG, it will drop the speed by one rank (fall-back). When the international mode is switched ON, each speed will be tried only twice. In other words, the slower speed with fewer errors can be accessed more easily. This is done because the line conditions may deteriorate and the picture may be disturbed more easily during communication for international lines or long distance communication, even when the training is OK. The default value is ON as preference is given to clearer pictures rather than speed.

**(Cause B)**

The echo canceler operation stops with a 2100Hz signal. (i.e. S1 and S2 become ON). Accordingly, when FAX1 has executed automatic reception, a CED signal is output. If this signal is 2100Hz, S1 and S2 will become ON. Then the echo of the DIS signal output afterwards may be received and FAX1 may execute

**an erroneous operation, preventing communication from starting.  
(Countermeasure B)**

**In the service mode, the CED signal frequency is set to 1100 Hz (code No.520), or the time setting between the CED signal and the DIS signal is set from 75 msec to 500 msec in the service mode (code No.593). This is because the echo canceler operation stop mode is canceled by an interval of 250 msec or more. / Reduce receiving sensitivity to reduce the effect of RCV echo signal.**

**(Service mode: code No. 598)**

**(Cause C)**

**This model is FAX1 and the other party is FAX2.**

**For transmission from this model to FAX2, FAX2 executes automatic reception and transmits a CED signal (2100 Hz) followed by a DIS signal. As the echo cancelers stops as described in cause B, the echo of the DIS signal returns to FAX2. On the other hand, this model detects the DIS signal and transmits a DCS signal. In other words, it is possible that the echo of the DIS signal and the DCS signal transmitted from this model reach FAX2 one after the other. FAX2 detects an error and communication does not start.**

**(Countermeasure C)**

**When the international DIS detection setting is set in the service mode (code No.594), this model does not respond to the first DIS signal and returns a DCS signal only for the second DIS signal. In other words, there is an interval of 250 msec between transmission of the first and second DIS signal so that the echo cancelers operation recovers. An echo is not generated for the second DIS signal.**

**Note:**

**When the other FAX does not respond with a DCS signal after DIS signal transmission, the DIS signal is transmitted three times for trial.**

**Summary:**

**Symptom/Countermeasure Table (Long distance and international communication operations)**

SYMPTOM	COUNTERMEASURE
Does not receive in the automatic mode.	1. If possible, manual transmission should be done from the transmission side. 2. If possible, two pauses should be inserted at the end of the auto dial number on the transmission side. 3. If possible, the Function Selector Switch should be switched to FAX.
Does not transmit.	1. Confirm the international line mode is ON. (Service mode: code No. 521) 2. Set the international DIS detection. (Service mode: code No. 594)
Does not receive.	1. Set the time setting between the CED signal and the DIS signal to 500 msec. (Service mode: code No. 593) 2. Set the CED frequency to 1100Hz. (Service mode: code No. 520)

## 6. The unit can copy, but the transmission and reception image are incorrect.

(Long distance or international communication operation)

This symptom highly depends on the transmission and reception capability of the other FAX unit and the line conditions.

The countermeasures for this unit are shown below.

### Transmission Operation:

Set the transmitting speed to 4800BPS (service mode: code No. 717) or select the overseas mode.

### Reception Operation:

If 80% or more of the reception is incorrect, set the receiving speed to 4800BPS. (Service mode: code No. 718)

- Refer to 2.4.4. SERVICE FUNCTION TABLE.

## 7. How to output the Journal Report:

A. Press the MENU button.

B. Press "#", then " 8 " and " 4 ".

C. Press the START/COPY/SET button.

D. The report prints out.

JOURNAL

(1) CODE	(2) RESULT	(3) MODE	SYMPTOM	Countermeasure
79	CANCELED	TX	The multistation transmission was rejected by the user.	
FF	COMMUNICATION ERROR	TX & RX	Modem error. For the DCN, DCN, etc. abbreviations, refer to 6.6. MODEM SECTION.	

### **TX=TRANSMISSION RX=RECEPTION**

**Most fax communication problems can be resolved by the following steps.**

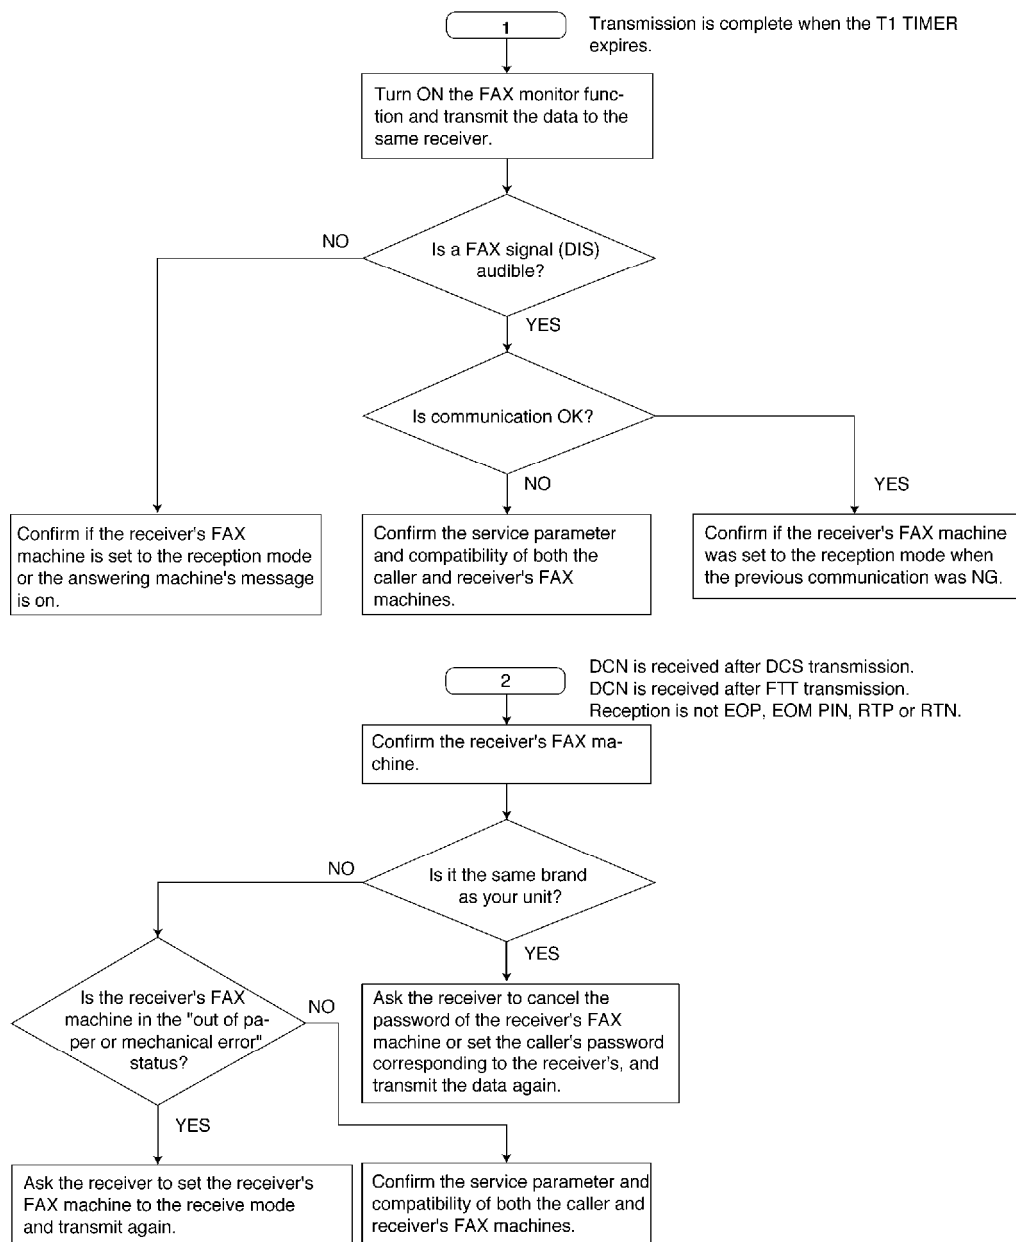

- A. Change the transmit level. (Service code: 596, refer to 2.4.4. SERVICE FUNCTION TABLE.)**
- B. Change the TX speed/RX speed. (Service code: 717/718, refer to 2.4.4. SERVICE FUNCTION TABLE.)**

**Note\*:**

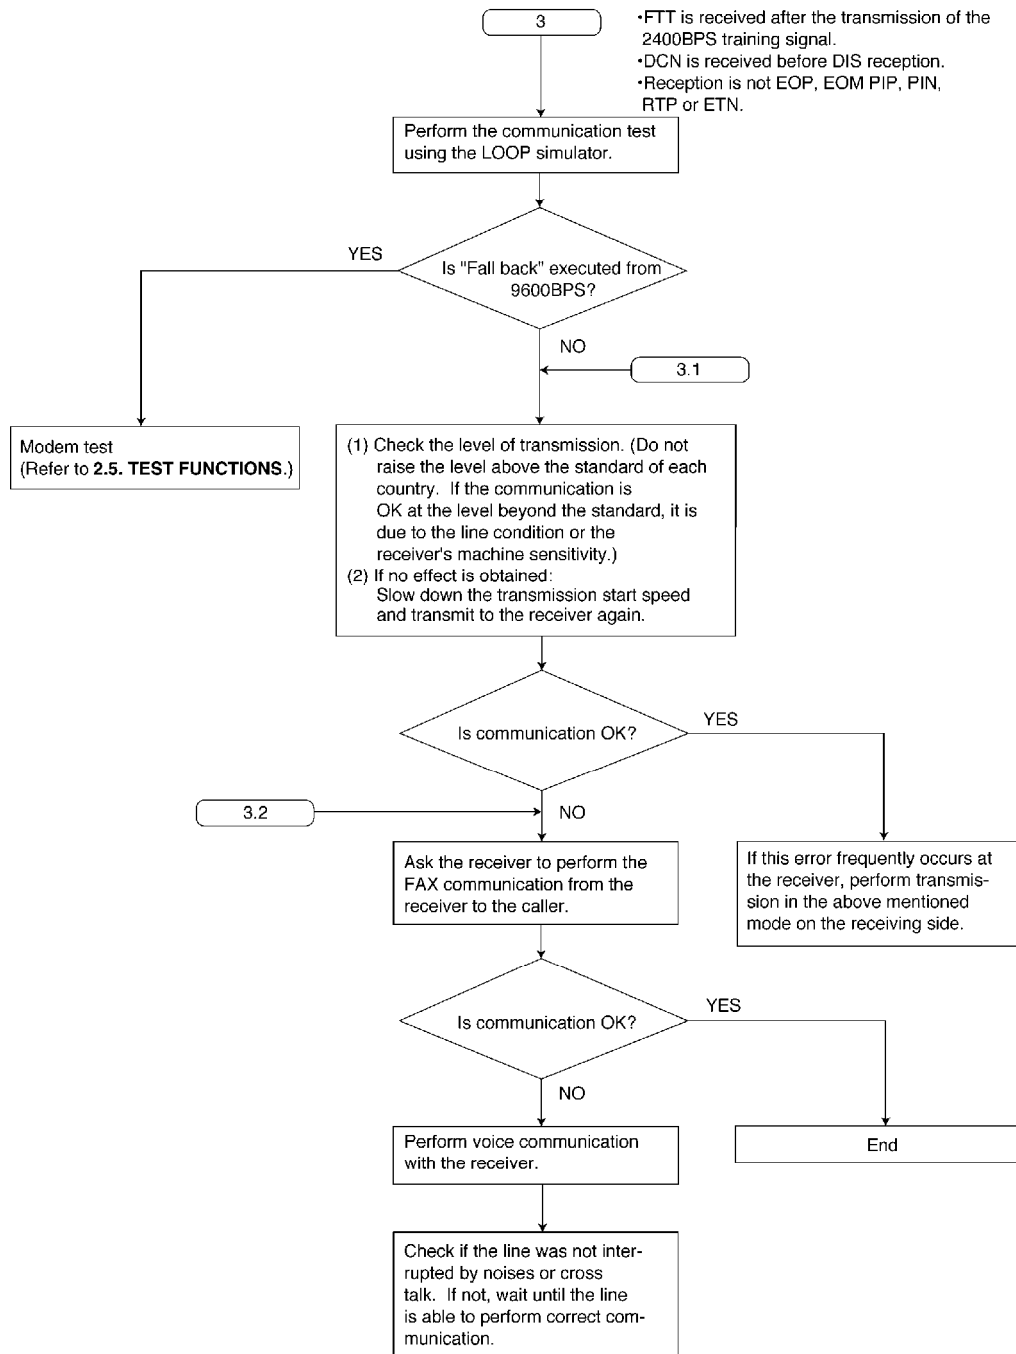

If the problem remains, see the following "Countermeasure" flow chart.

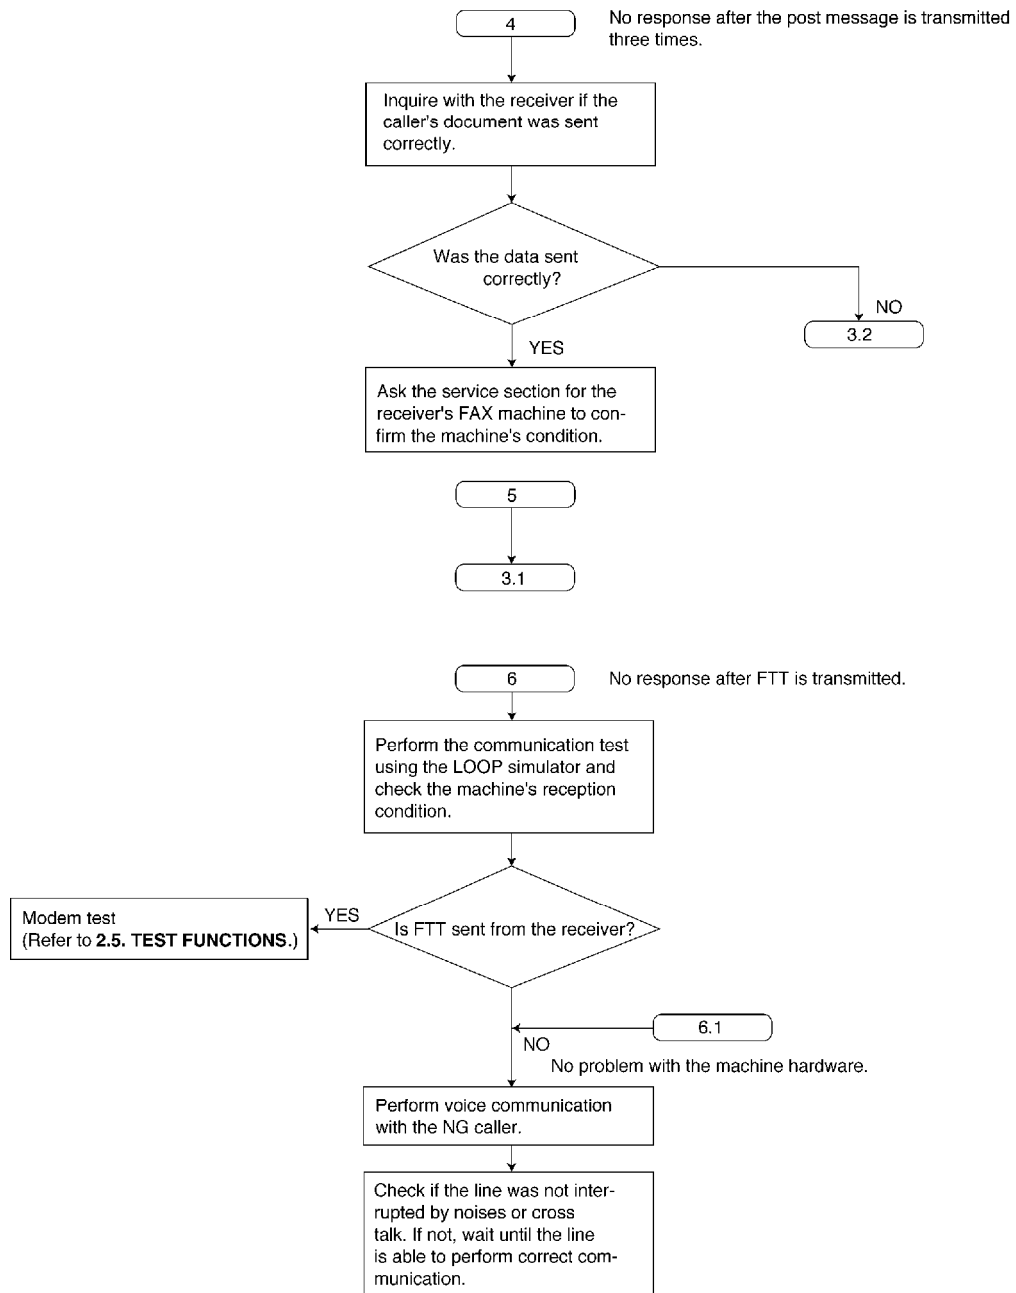

## Countermeasure

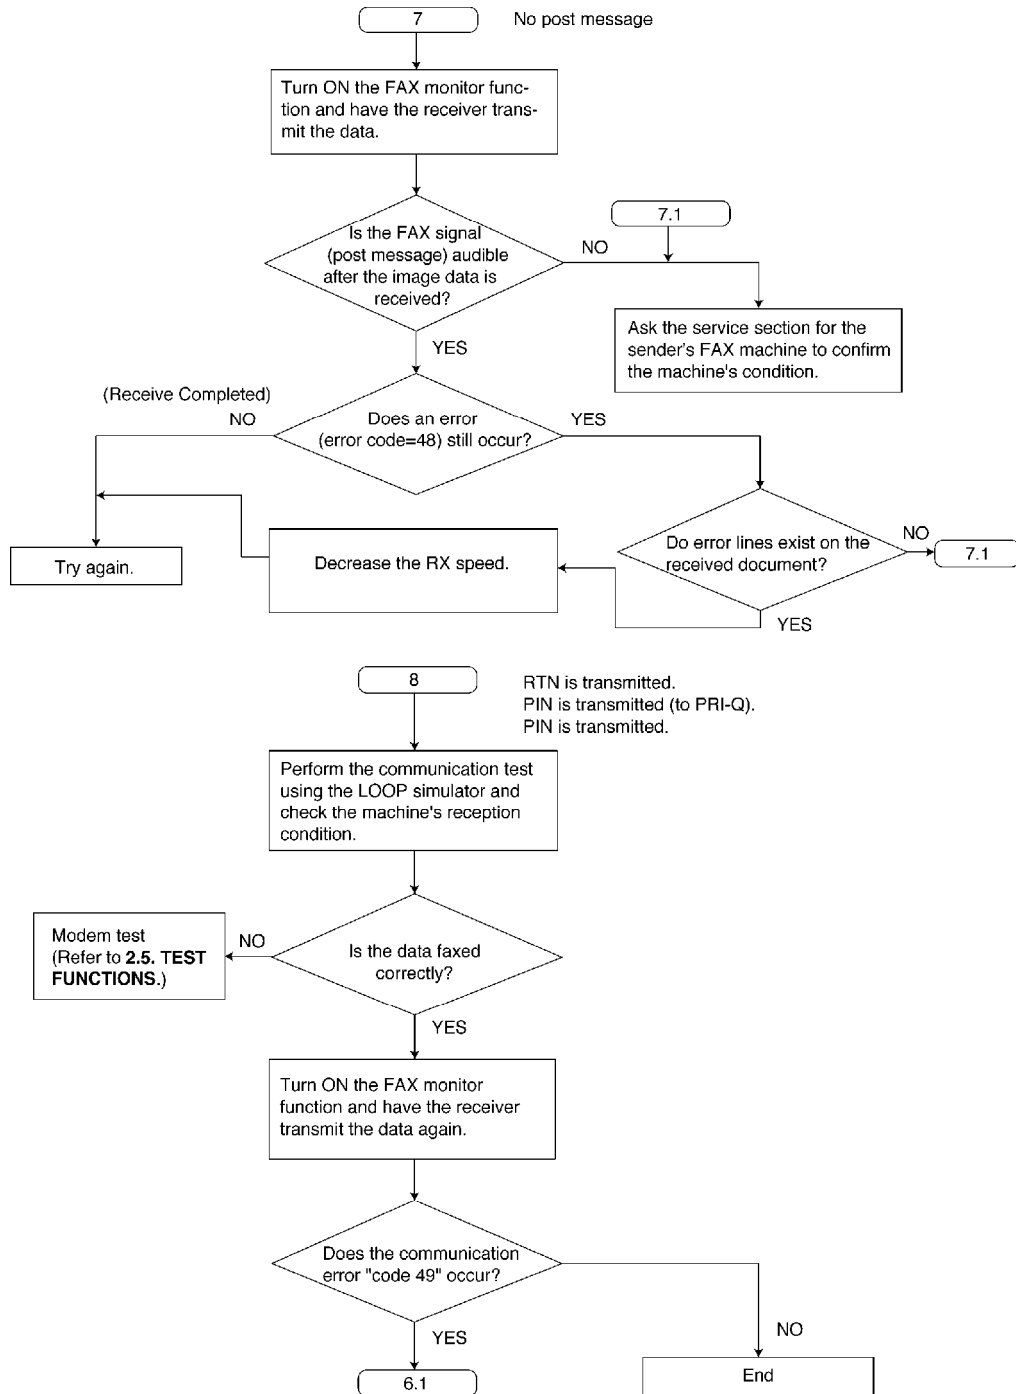

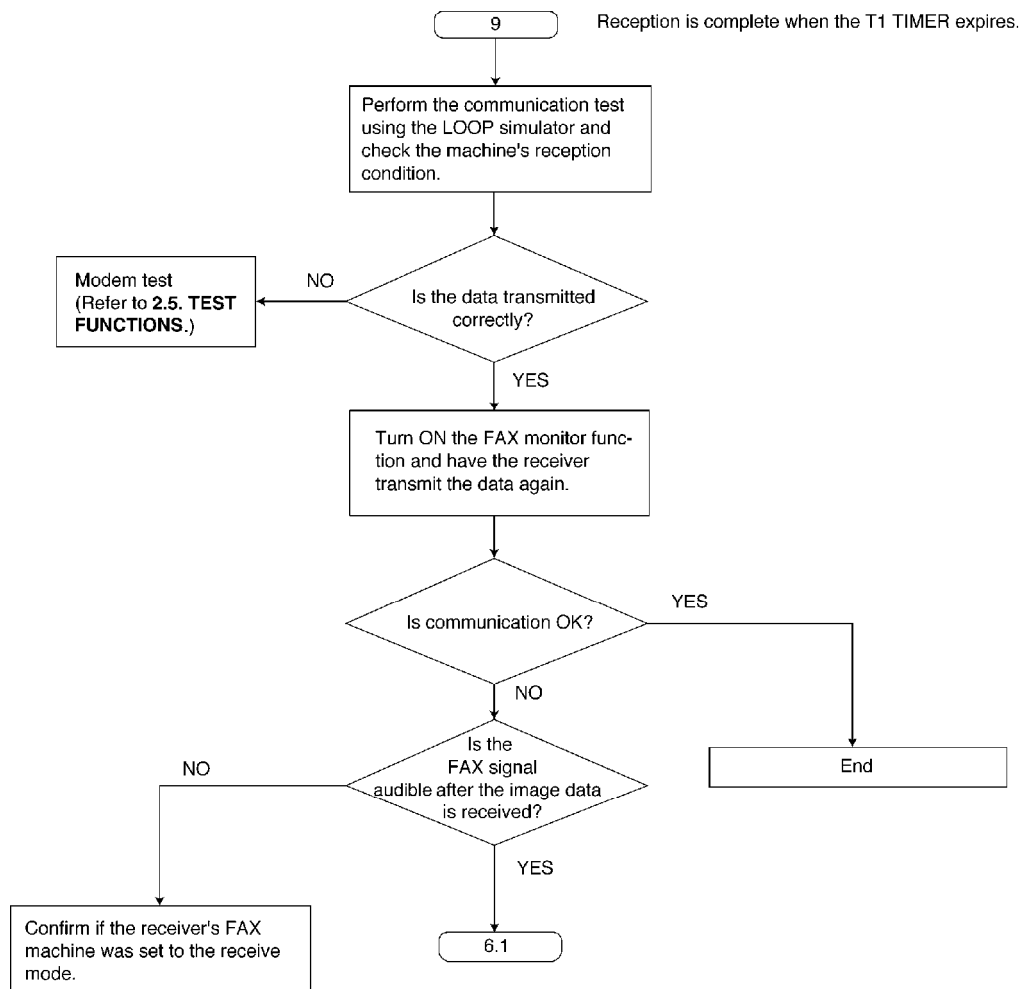

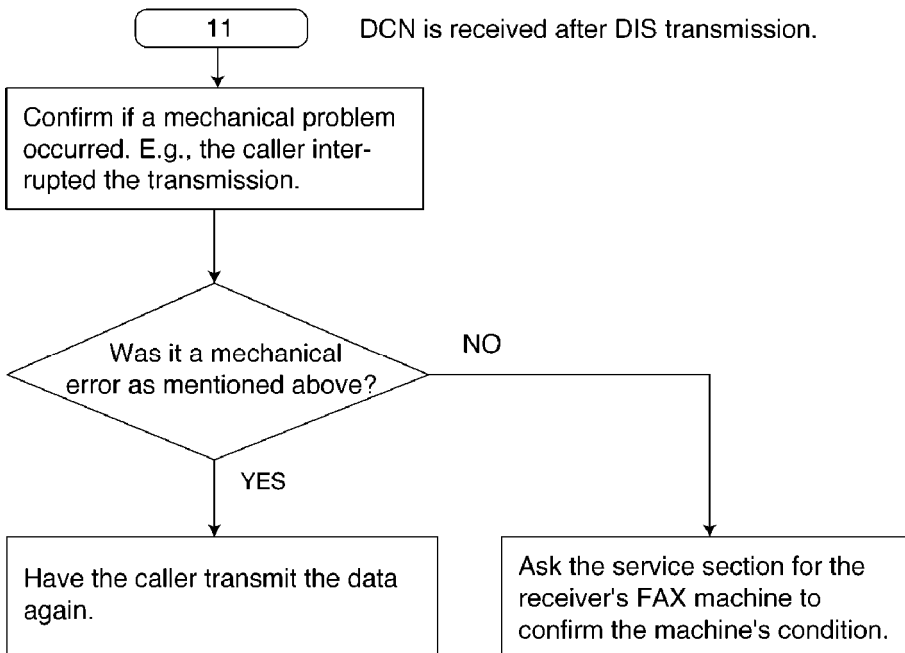

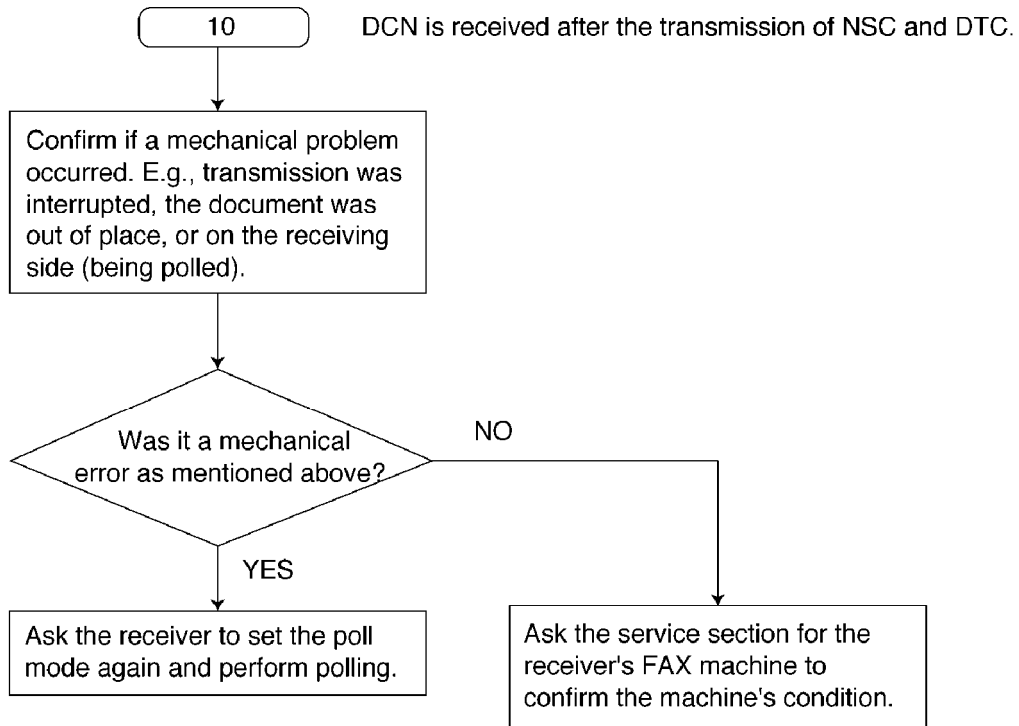

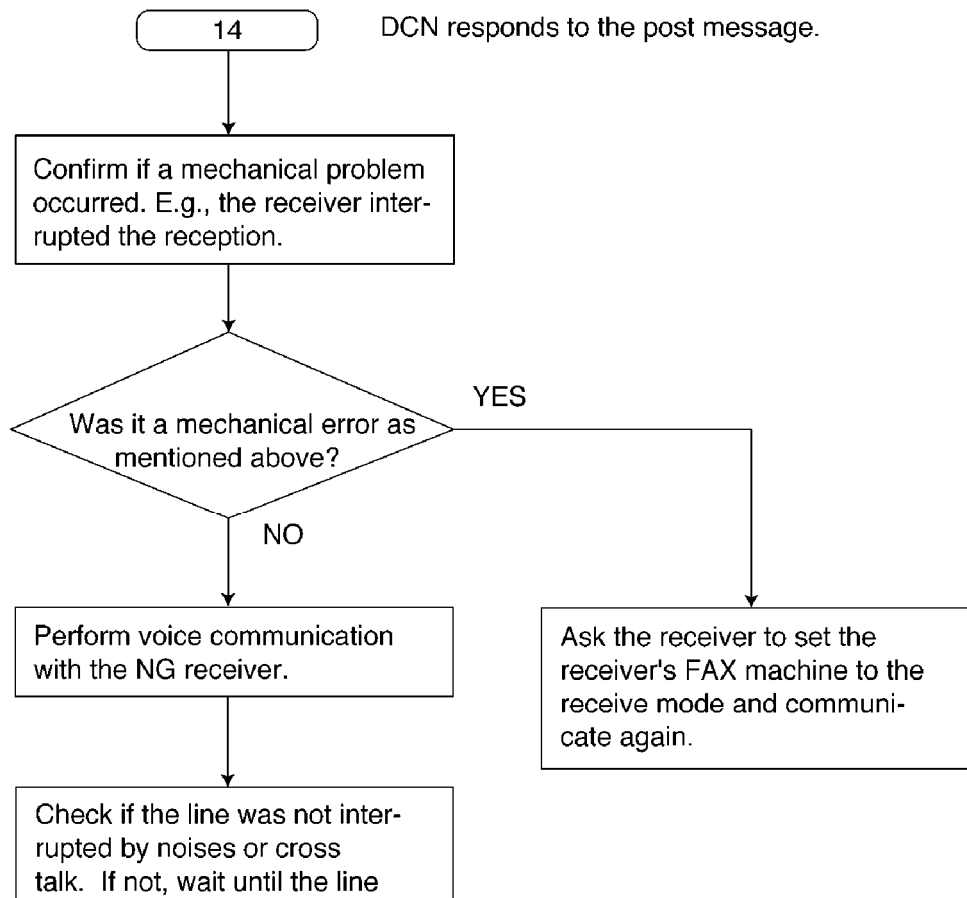

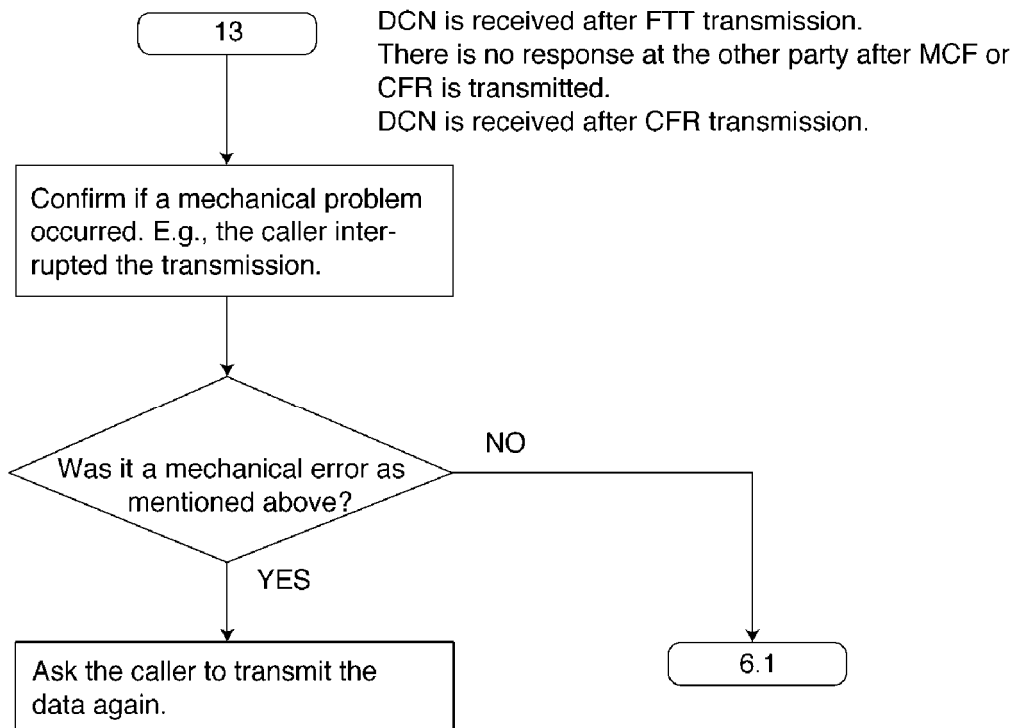

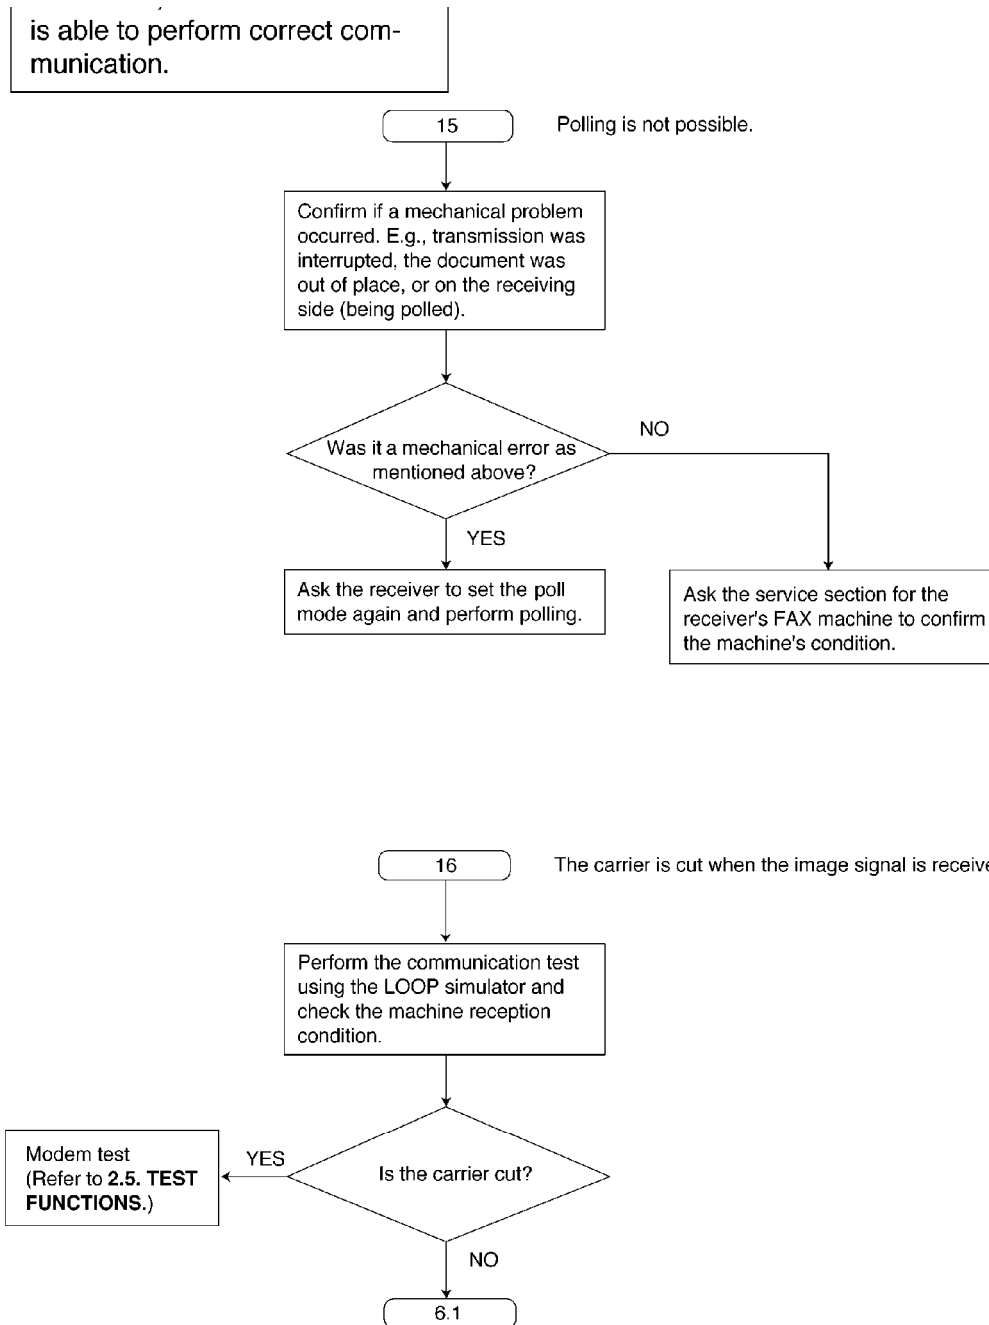

hardware.

#### 2.3.3.3.2. Remote programming

If, after the call is connected, the customer describes the situation and it is determined that the problem can be corrected by making parameter changes, this function makes it possible to change parameters such as the user code and service code from another fax (using DTMF tones). Therefore, travel to the customer's location is not required. However, it is not possible to change all the parameters remotely (2. Program mode table). The function used to accomplish this is remote programming.

First, in order to check the current status of the service code parameter, print out the setup list (code: 991) and the service list (code: 999) from the customer's fax machine.

Based on this, the parameters for the desired codes can be changed.

The procedure for changing and listing parameters is described on 1. Entering the remote programming mode and changing service codes. Also, before exiting the remote programming

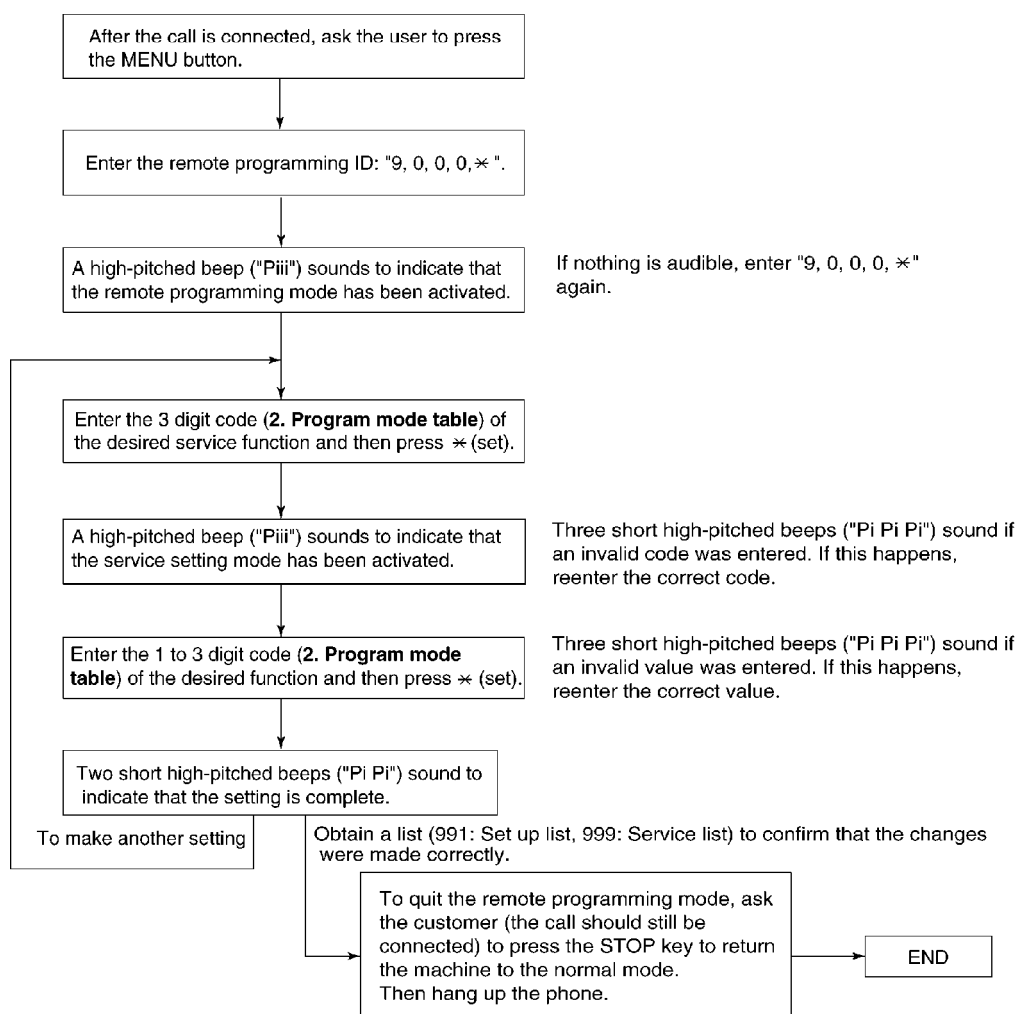

mode, it is advisable to obtain a new list to confirm that the changes were made correctly.

#### Hint:

Since the connected telephone is in use during the remote programming mode, it may be helpful to ask the customer to switch to the speakerphone. This frees the customer from the need to remain right next to the fax while you are making parameter settings. When finished, inform the customer. Also note that in very noisy locations where the DTMF tones are not audible, the remote programming function will not work.

## 1. Entering the remote programming mode and changing service codes

## 2. Program Mode Table

Code	Function	Set Value	Default	Remote Setting

**OK means "can set".**

**NG means "can not set".**

**Note:**

Refer to 2.4.4. SERVICE FUNCTION TABLE for descriptions of the individual codes.

**Example:**

If you want to set value in the "004 Transmission report mode", press the dial key number **1**,  
**2** or **3** corresponding to the Set Value you want to select. (1:ERROR/2:ON/3:OFF)

#### 2.3.3.4. Digital Board Section

When the unit fails to boot up the system, take the troubleshooting procedures very carefully. It may have a serious problem.

The symptom: No response when the power is turned on. (No LCD display, and keys are not accepted.)

The first step is to check the power source. If there is no problem with the power supply unit, the problem may lie in the digital unit (main board).

As there are many potential causes in this case (ASIC, DRAM, etc.), it may be difficult to specify what you should check first. If a mistake is made in the order of checks, a normal part may be determined faulty, wasting both time and money.

Although the tendency is to regard the problem as a serious one (IC malfunction, etc.), usually most cases are caused by solder faults (poor contact due to a tunnel in the solder, signal short circuit due to solder waste).

**Note:**

1. Electrical continuity may have existed at the factory check, but a faulty contact occurred as a result of vibration, etc., during transport.

## 2. Solder waste remaining on the board may get caught under the IC during transport, causing a short circuit.

Before we begin mass production, several hundred trial units are produced at the plant, various tests are applied and any malfunctions are analyzed. (In past experiences, digital IC (especially SRAM, DRAM and ROM) malfunctions are extremely rare after installation in the product.) This may be repaired by replacing the IC, (DRAM etc.). However, the real cause may not have been an IC malfunction but a soldering fault instead.

Soldering faults difficult to detect with the naked eye are common, particularly for ASIC and RA (Resistor Array). But if you have an oscilloscope, you can easily determine the problem site or IC malfunction by checking the main signal lines.

Even if you don't have such a measuring instrument, by checking each main signal line and resoldering it, in many cases the problem will be resolved.

An explanation of the main signals (for booting up the unit) is presented below.

Don't replace ICs or stop repairing until checking the signal lines.  
An IC malfunction rarely occurs. (By understanding the necessary signals for booting up the unit, the "Not Boot up" display is not a serious problem.)

**What are the main signals for booting up the unit?**

Please refer to 2.3.3.4.1. Digital Block Diagram.

The ASIC (IC501) controls all the other digital ICs. When the power is turned on, the ASIC retrieves the operation code stored in the ROM (IC502), then follows the instructions for controlling each IC. All ICs have some inner registers that are assigned to a certain address. It is the address bus by which the ASIC designates the location inside each IC. And the data bus reads or writes the data in order to transmit the instructions from the ASIC to the ICs. These signal lines are all controlled by voltages of 5V (H) or 0V (L).

### 2.3.3.4.1. Digital Block Diagram

You also need to check the signal lines listed here [List 1] when the unit fails to boot up the system. Those signal lines should remain normal. Other signal lines are not directly related to that failure even if they have faults or troubles.

[List 1]

- |   |                    |                                     |
|---|--------------------|-------------------------------------|
| ① | D0~D7              | (Data Bus)                          |
| ② | A0~A15             | (Address Bus)                       |
| ③ | $\overline{RD}$    | (Read Signal)                       |
|   | $\overline{ROMCS}$ | (ROM Select Signal)                 |
|   | $\overline{WR}$    | (Write Signal)                      |
|   | $\overline{RAMCS}$ | (SRAM Select Signal)                |
| ④ | RBA0~RBA5          | (Bank Address Signal)               |
| ⑤ | $\overline{RAS}$   | (DRAM Row Address Strobe Signal)    |
|   | $\overline{CAS}$   | (DRAM Column Address Strobe Signal) |
| ⑥ | $\overline{MDMCS}$ | (Modem Select Signal)               |

As long as these signals remain normal, once the power is turned on, each IC can repeatedly output 5V (H) and 0V (L). The following shows NG and normal wave patterns.

**NG Wave pattern (Refer to NG EXAMPLE)**

Short between D0 and D1  
500ns/div, 1V/div

**Normal Wave Patterns**

① D0~D7 200ns/div, 1V/div

② A0~A5 200ns/div, 1V/div

③  $\overline{RD}$  100ns/div, 1V/div

④  $\overline{ROMCS}$  500ns/div, 1V/div

⑤  $\overline{RAMCS}$  500ns/div, 1V/div

⑥  $\overline{RAS}$ ,  $\overline{CAS}$  100ns/div, 1V/div

#### Remarks:

When you use an oscilloscope to judge whether a signal to be tested is normal or NG, perform the signal check in exactly the same order as in [List 1]. (If the ASIC fails to access the ROM, the ASIC cannot access SRAM or DRAM normally.)

The digital circuit actually operates according to the timing combinations of these signals. If the timing of these signals is even slightly delayed, the circuit will not work. Nor will it if the IC is

defective and the output voltage level is not normal although the timing of these signals is accurate enough to meet the specifications. (Make sure that your oscilloscope is calibrated before starting a test.)

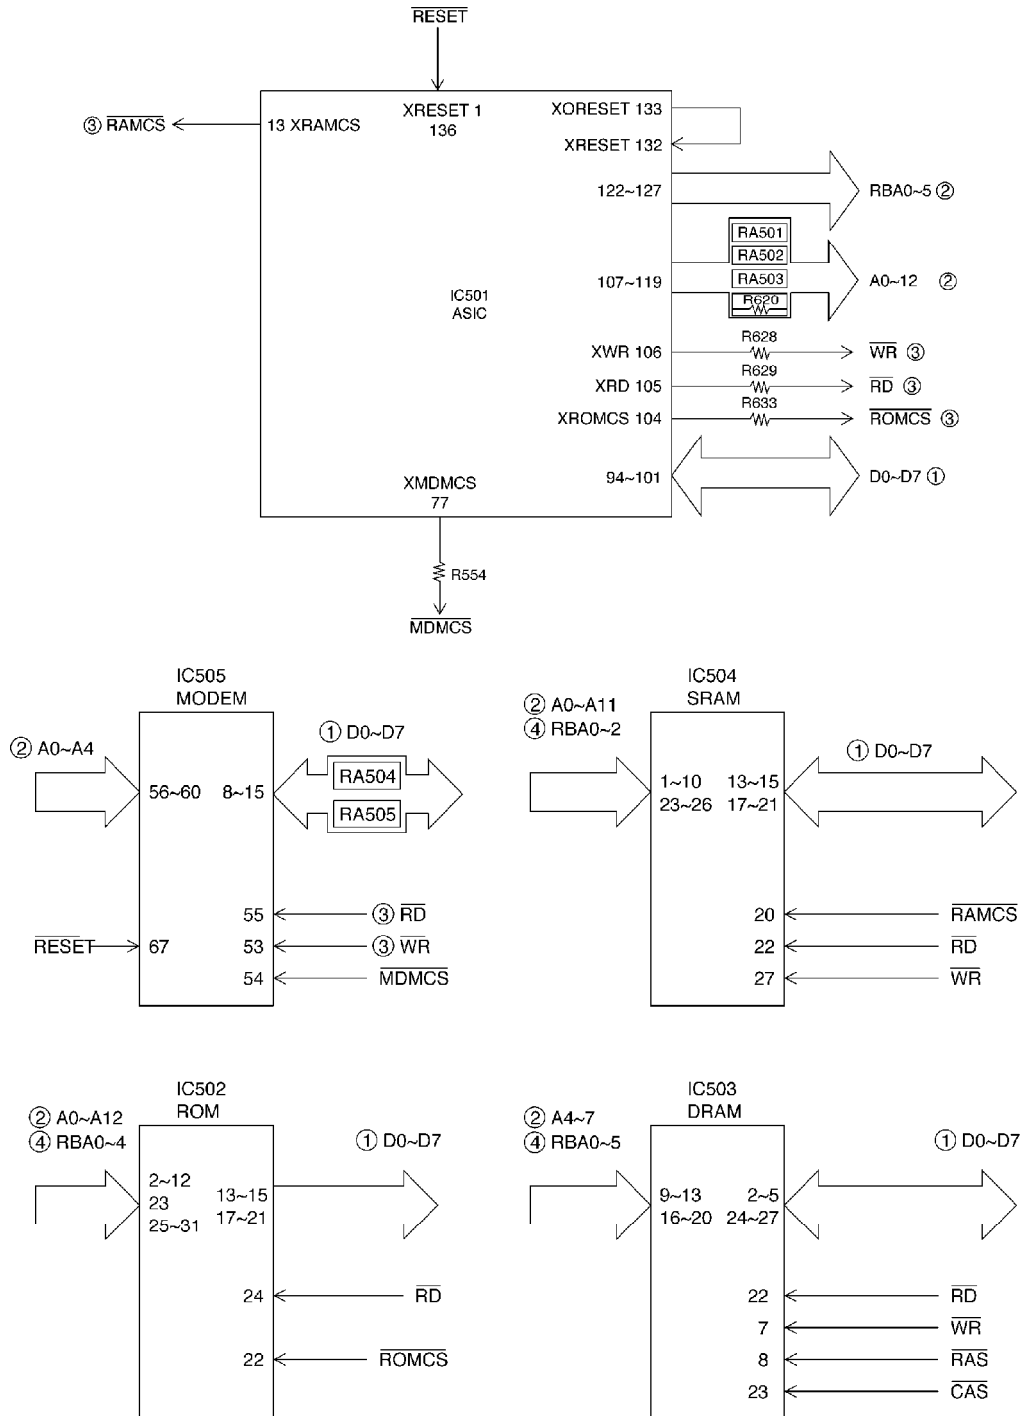

Therefore, it is imperative to confirm whether each IC outputs the signal at the correct level. (See the I/O Pin No. Diagram.) The signal level should be constantly output at between 5V (H) and 0V (L) as described earlier.

**Note:**

Simply check the output level and make sure if the IC repeatedly outputs the signal at between 5V (H) and 0V (L).

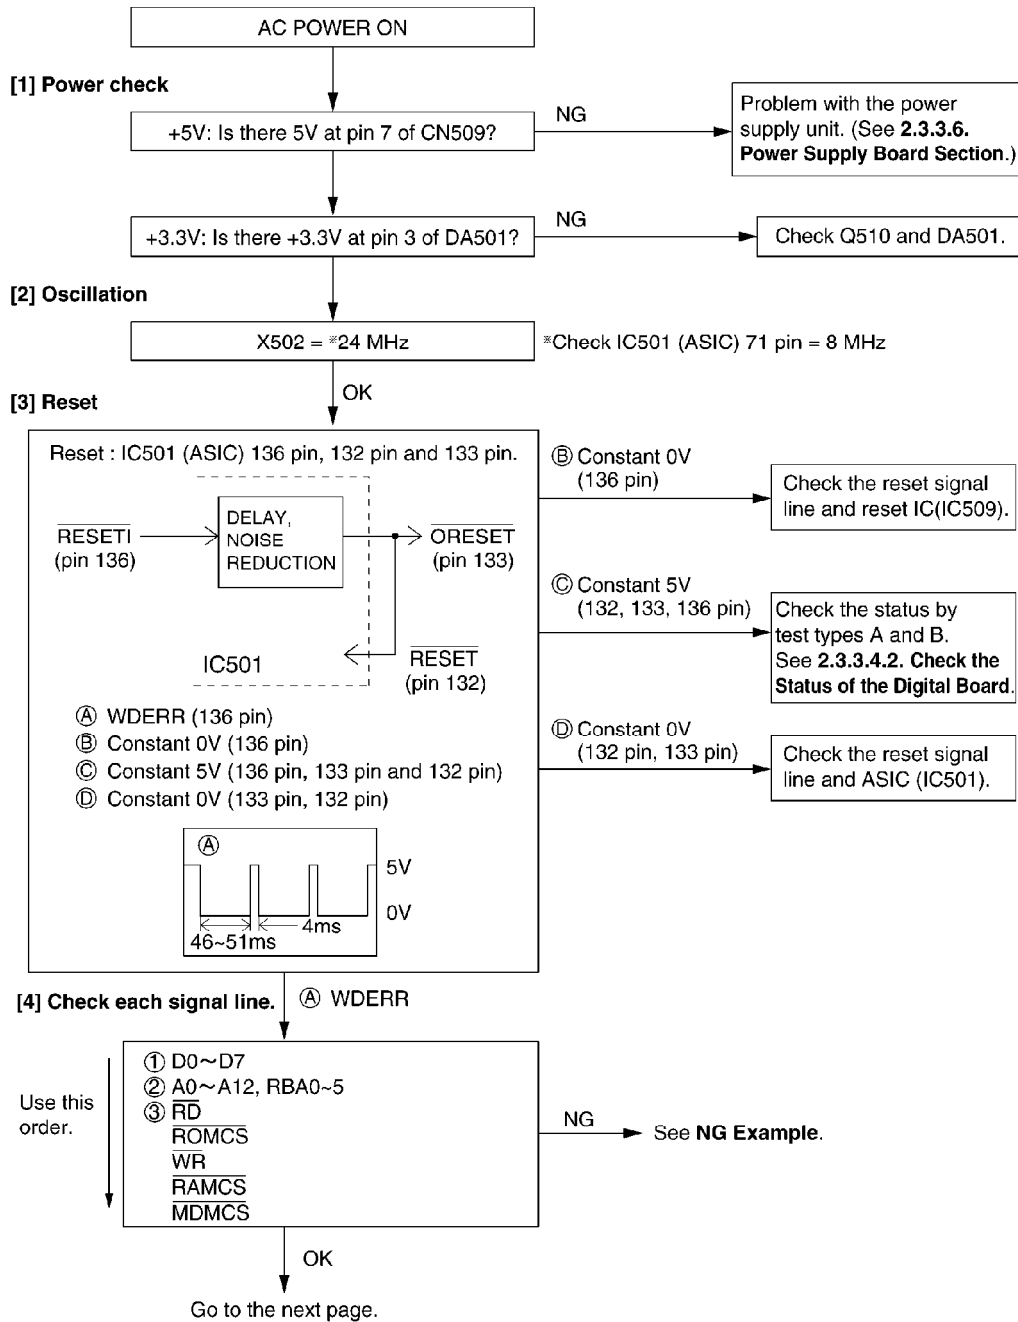

**I/O and Pin No. Diagram**

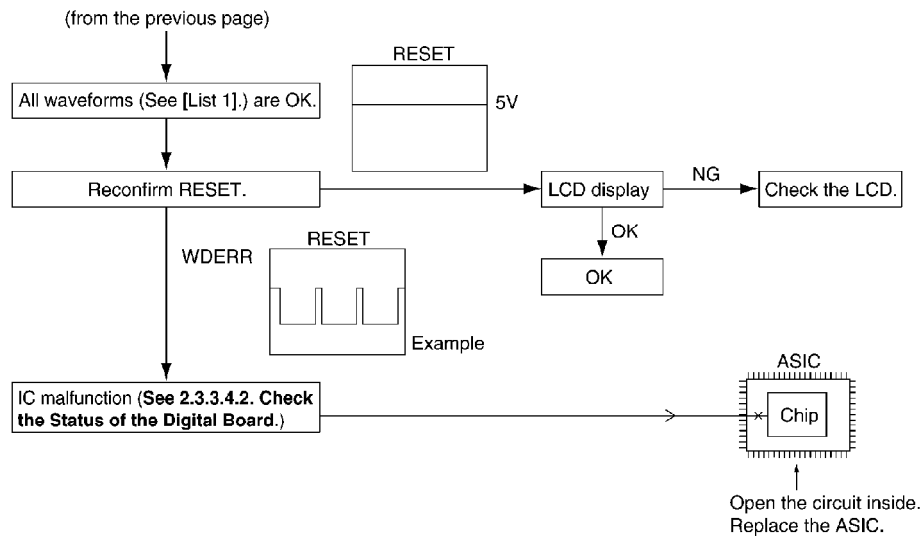

After the power is turned on, the ASIC initializes and checks each IC.  
The ROM, SRAM, and modem are checked.  
If initialization fails for the ICs, the system will not boot up.  
In this case, please find the cause as follows.

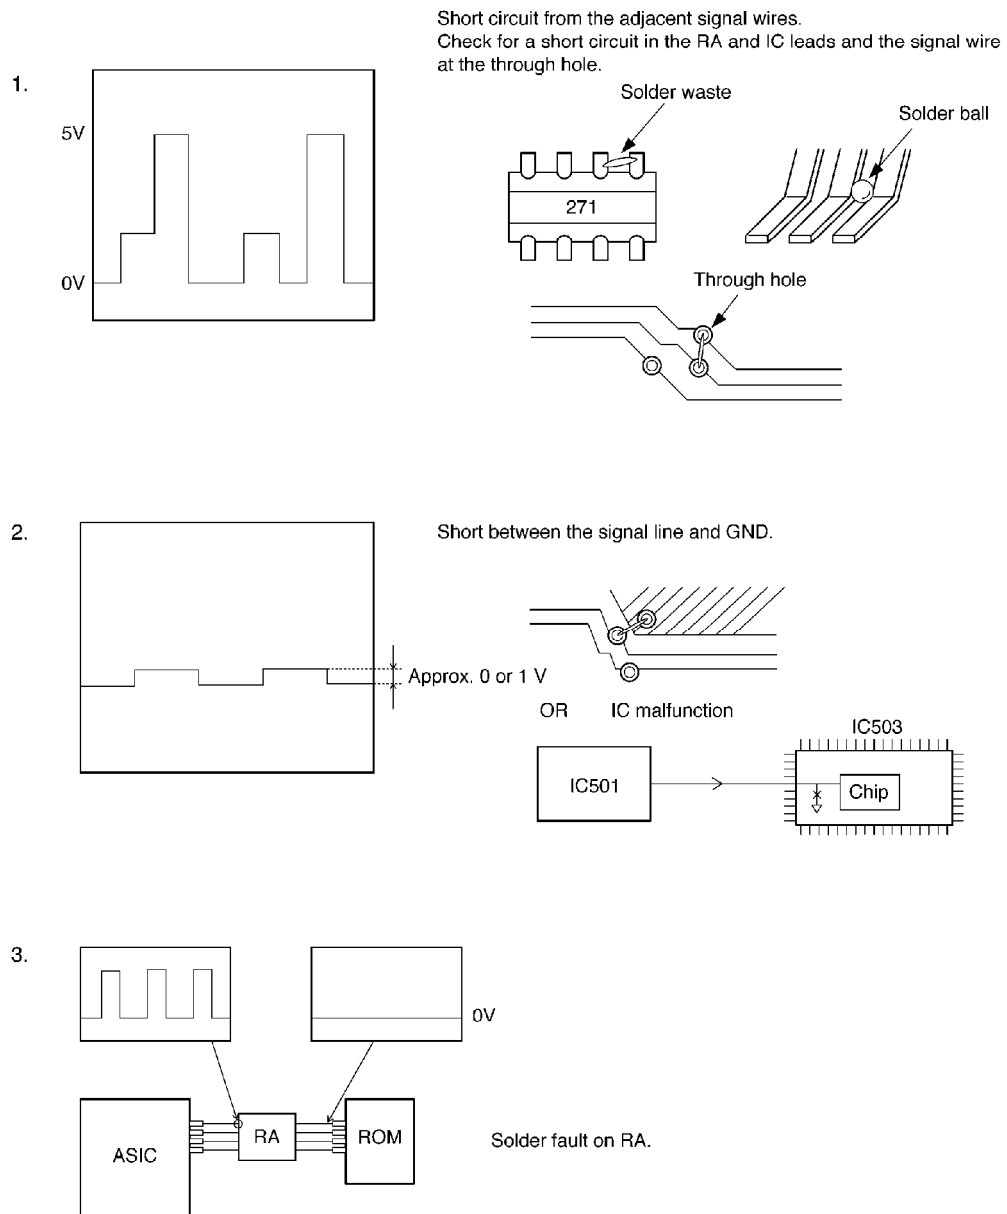

**Other NG examples while the power is ON and the LCD displays the following.**

## NG Example

#### 2.3.3.4.2. Check the Status of the Digital Board

Please check the status (voltage) of test lands **A** and **B**.  
The result may tell you a defective point.

- Turn off the power supply.
- Short using a metallic object, such as tweezers, between the **TEST** point and **+5V** land, and turn on the **AC** power for a few seconds. And then remove a metallic object.
- Check the following voltages using an oscilloscope or tester.
- To cancel the status check mode, turn off the **AC** power.

Defective point	Check point voltage			Check items
	A	B	C	
RTC (IC501)	0V	0V	0V	IC501( RTC is included in IC501)
DRAM (IC503)	0V	5V	0V	IC503(8,23 pin), R630, R631, IC501(88, 89 pin), L506
MODEM (IC505)	5V	0V	5V	IC501(77 pin), IC505(53~55 pin), R555, L503, C547, R563, R554, RA504, RA505
ALL OK	5V	5V	5V	

•This indicates that the Add/Data Bus, RAM, ROM, MODEM, and ASIC are all connected to the ASIC properly and that control from the ASIC is possible.

Please check the soldering and conduction of these components.  
If there is no problem, replace the ICs.

If you still have a problem with the digital board,  
please refer to **NG wave pattern**.

### 2.3.3.5. Analog Board Section

This chapter provides the testing procedures required for the analog parts. A signal route to be tested is determined depending upon purposes. For example, the handset TX route begins at the handset microphone and the signal is output to the telephone line. The signal mainly flowing on this route is analog. You can trace the signal with an oscilloscope. The signal flow on each route is shown in the Check Sheet here. If you find a specific problem in the unit, for example if you cannot communicate with the H/S, trace that signal route locally with the following Check Sheet and locate the faulty point.

**Note:**

**{ }:** Inside the digital board

## 1. Defective ITS (Integrated Telephone System) Section

### A. No handset and speakerphone transmission / reception

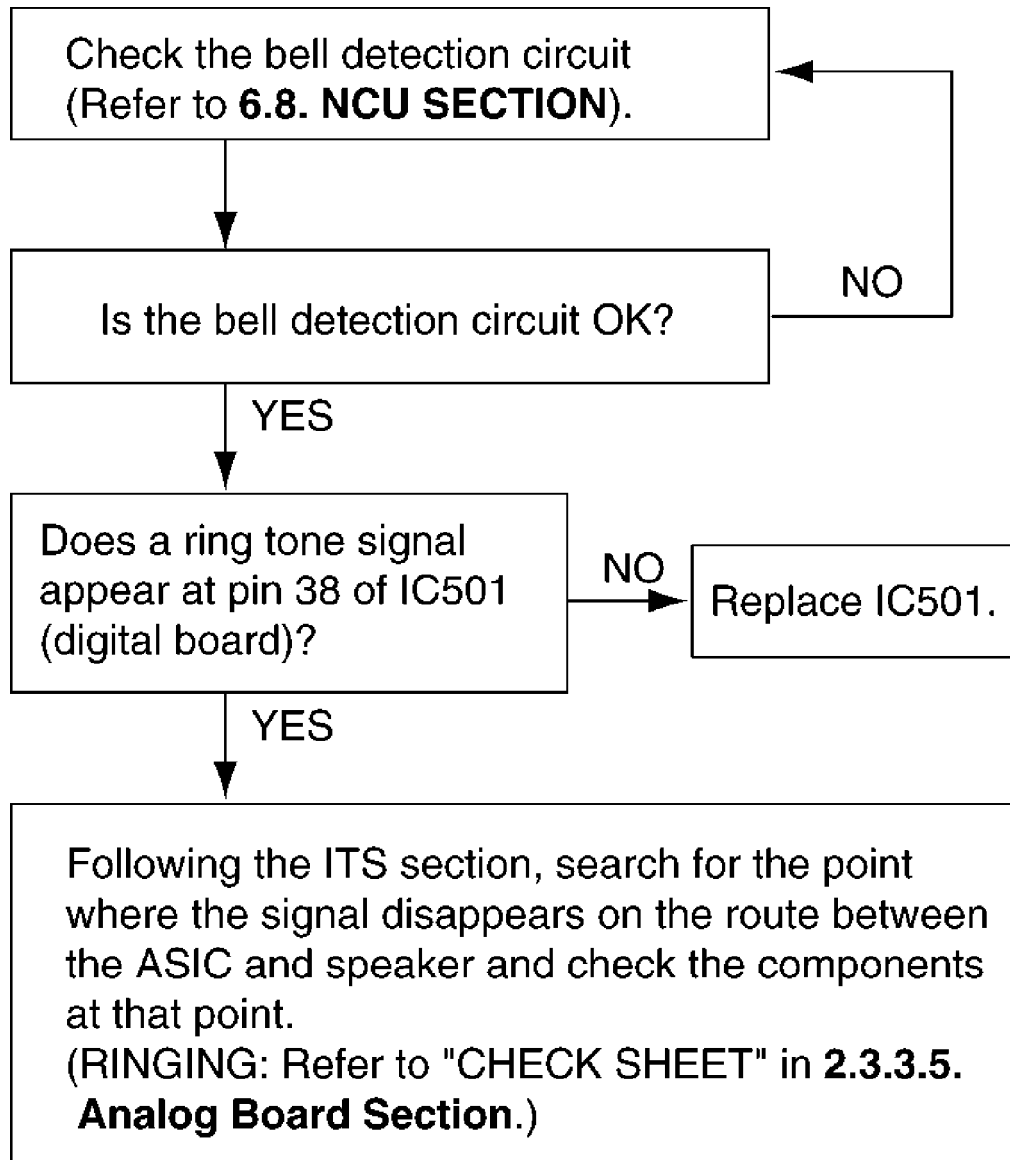

Perform a signal test in the ITS or the NCU section and locate a defective point (where the signal disappears) on each route between the handset microphone and telephone line (sending), or between the telephone line and the handset speaker (receiving), or between the microphone and the telephone line (sending), or between the telephone line and the speaker (receiving). Check the components at that point. "CHECK SHEET" in 2.3.3.5. Analog Board Section is useful for this investigation.

### B. No pulse dialing

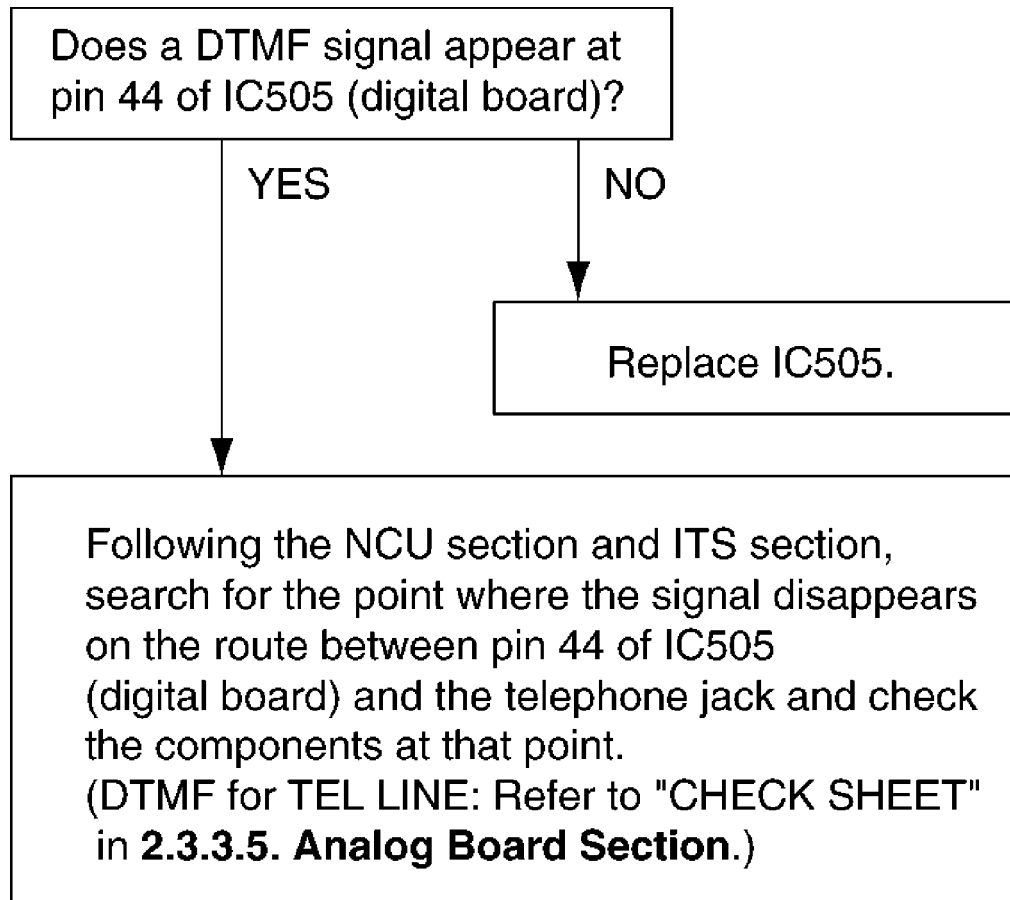

### C. No ring tone (or No bell)

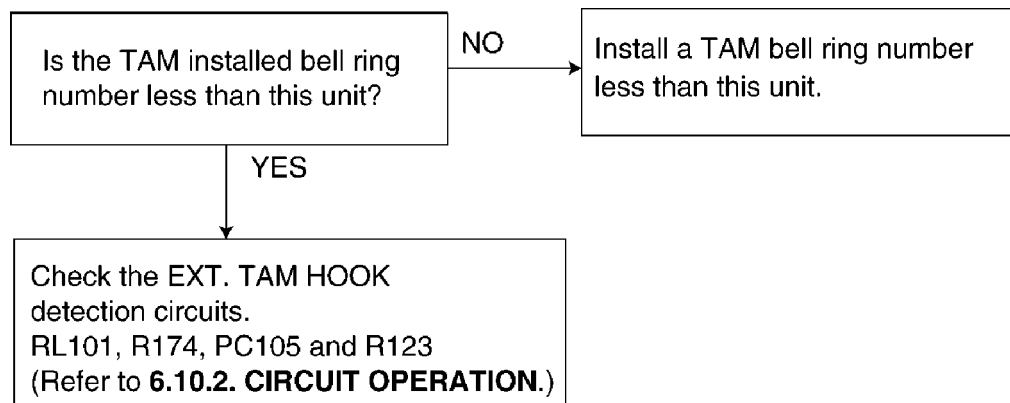

**D. No tone dialing**

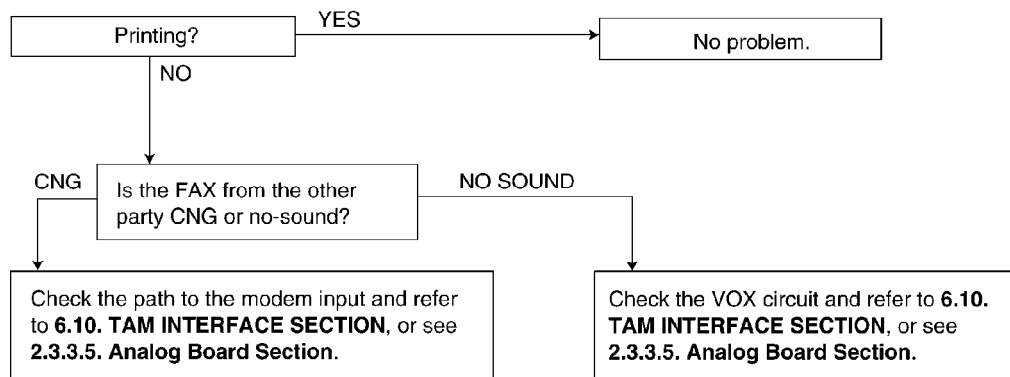

## 2. Defective TAM Interface Section

### A. The FAX turns on, but does not arrive through TAM.

### B. A FAX is received, but won't switch from TAM to FAX.

### C. A voice is coming in but the unit switches to the FAX.

Check the VOX circuit and refer to **6.10. TAM INTERFACE SECTION**, or see **2.3.3.5. Analog Board Section**.

#### 2.3.3.6. Power Supply Board Section

##### 1. Key components for troubleshooting

Check the following parts first: F101, D101-D104, C106, Q101, PC101 and IC101.

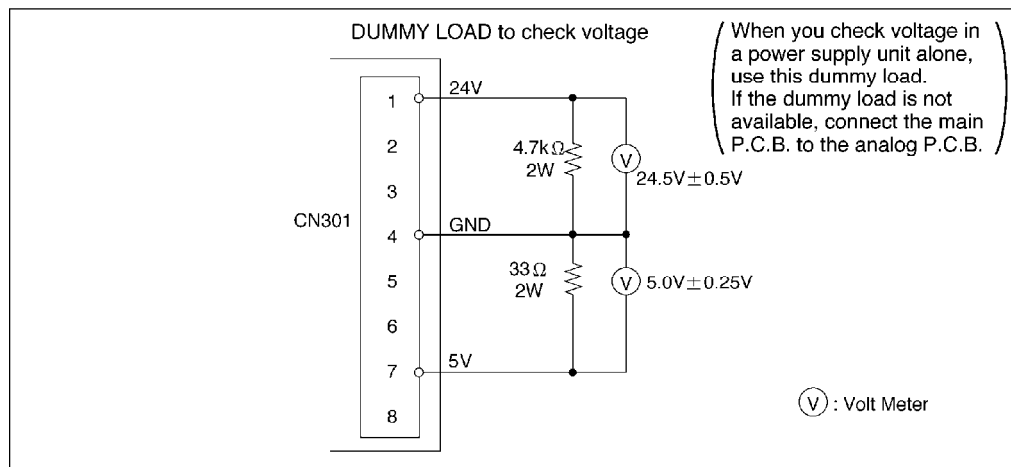

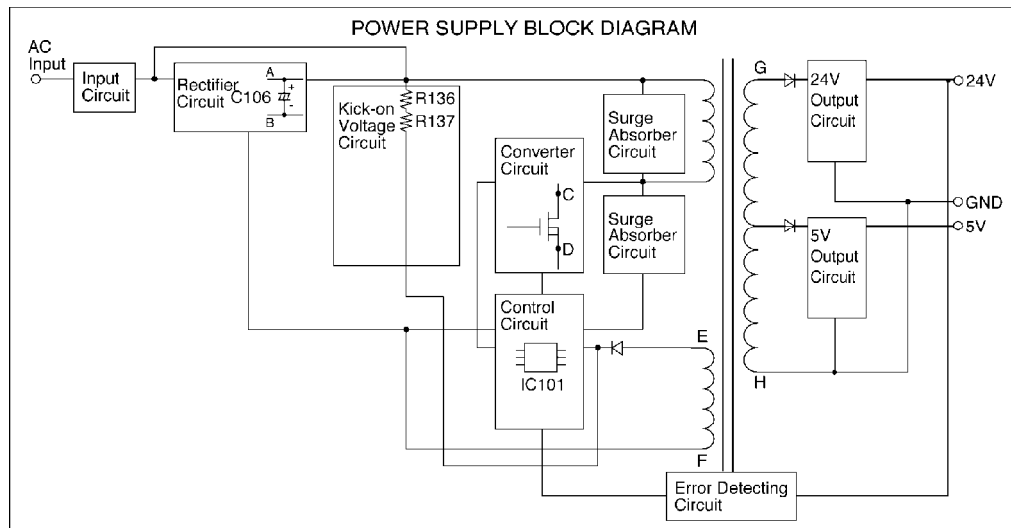

This comes from our experience with experimental tests. For example: power supply and lightning surge voltage test, withstanding voltage test, intentional short circuit test, etc.

##### **Caution:**

If you find a melted fuse in the unit, do not turn on the power until you locate and repair the faulty parts (except for the fuse); otherwise the fuse will melt again and you cannot pinpoint the faulty point.

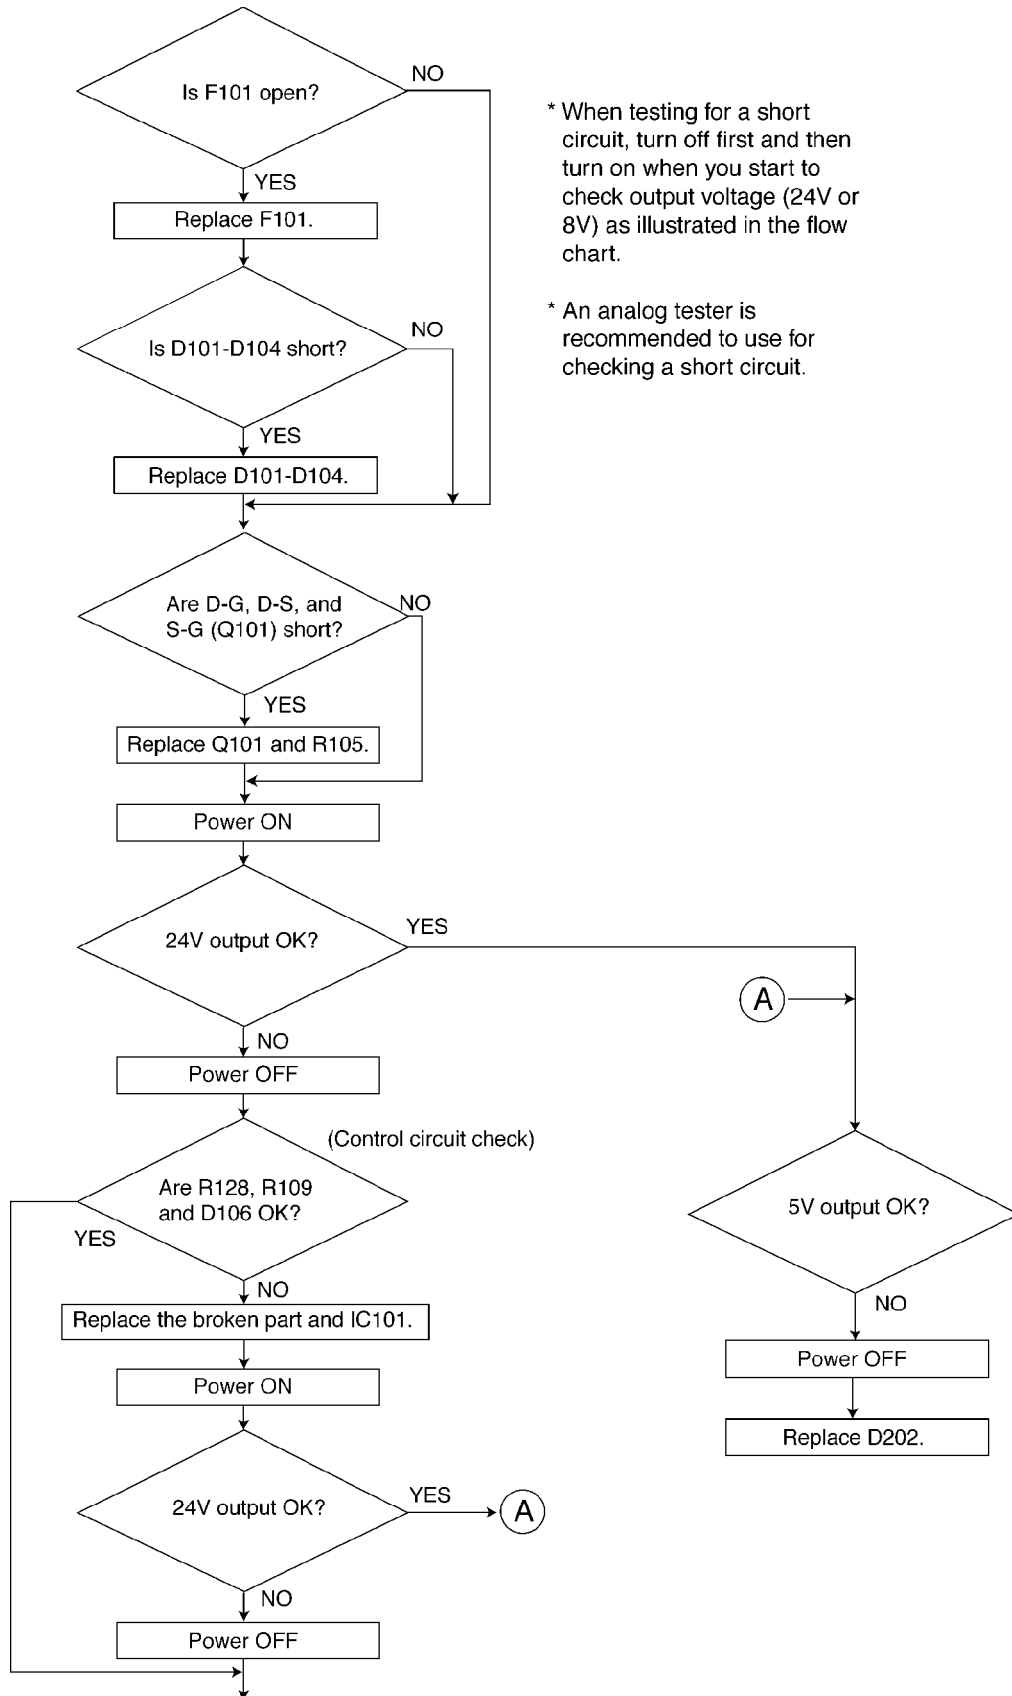

In most cases, the symptom is that nothing is output. It is more likely that the fault is in the primary side rather than the secondary side. Check the primary side first.

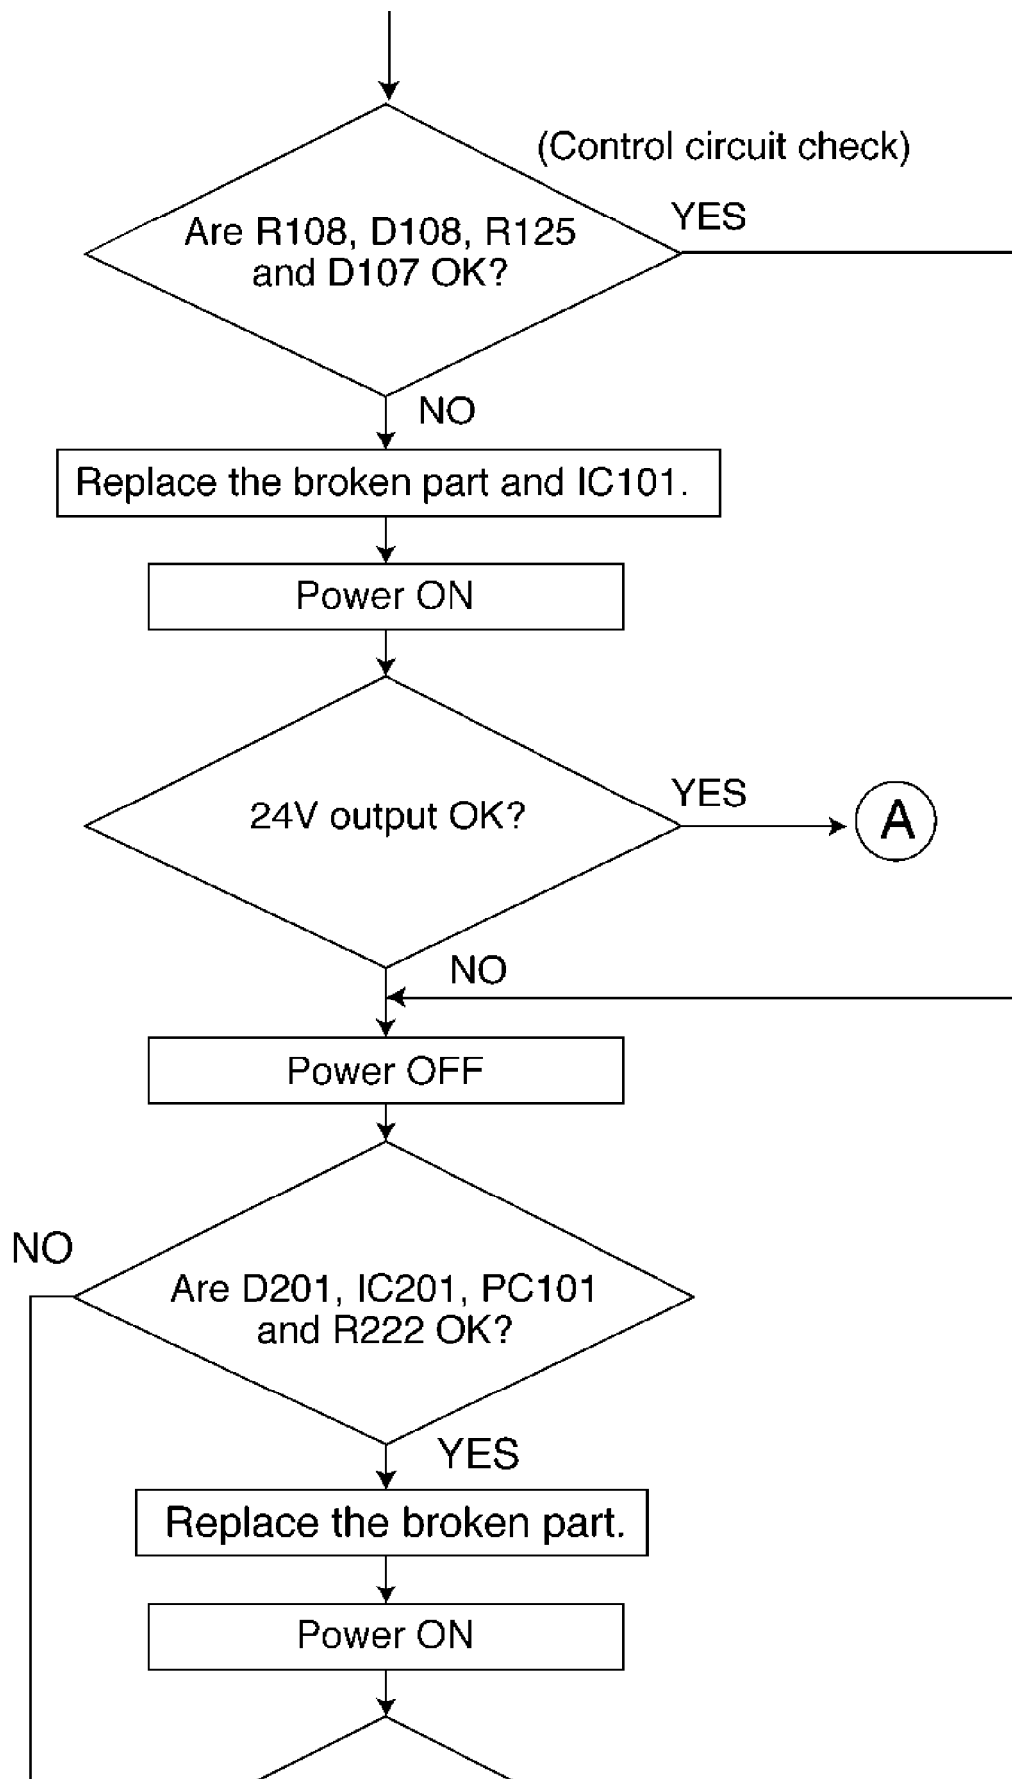

## 2. Troubleshooting Flow Chart

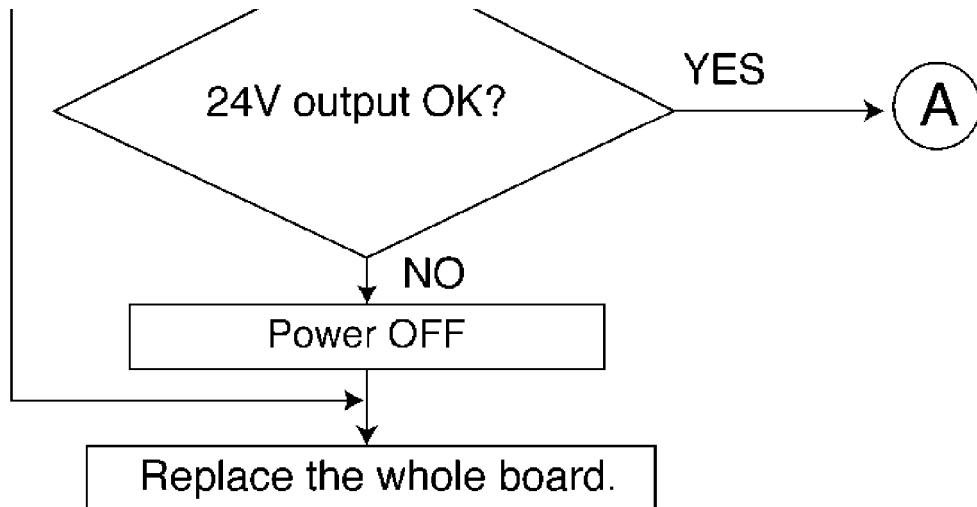

### 3. Broken parts repair details

(D101, D102, D103, D104)

Check for a short-circuit in terminal 4. If D101, D102, D103 and D104 are short-circuited, F101 will melt (open).

In this case, replace all of the parts (D101, D102, D103, D104, F101). (Q101)

The worst case of Q101 is a short-circuit between the Drain and Gate because damage expands to the peripheral circuit of Q101.

This is due to a very high voltage through the Gate circuit which is composed of R128, R109, D106 and IC101.

You should change all of the parts listed as follows.

F101, Q101, R128, R109, D106, IC101

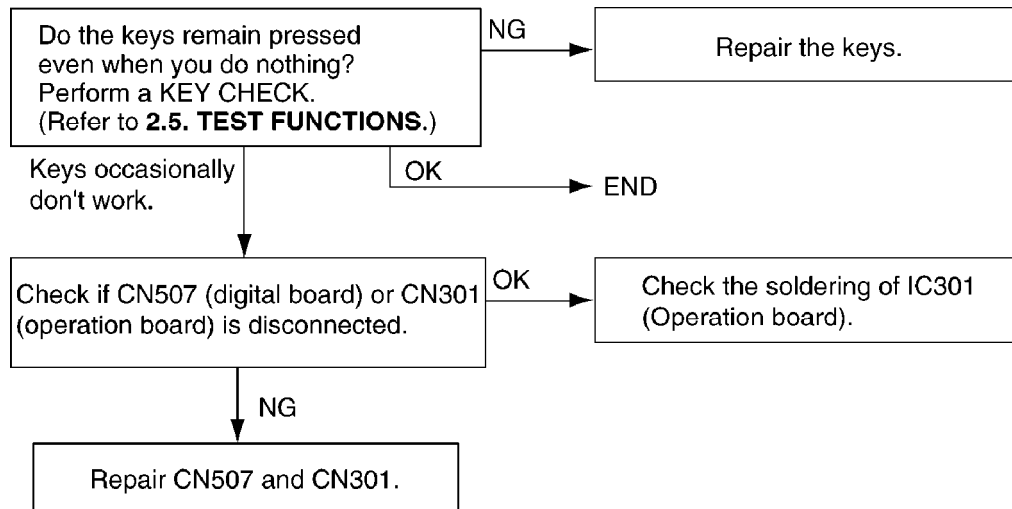

(D201)

If D201 is broken, the oscillation circuit in the power supply cannot operate. Check it with an electric tester.

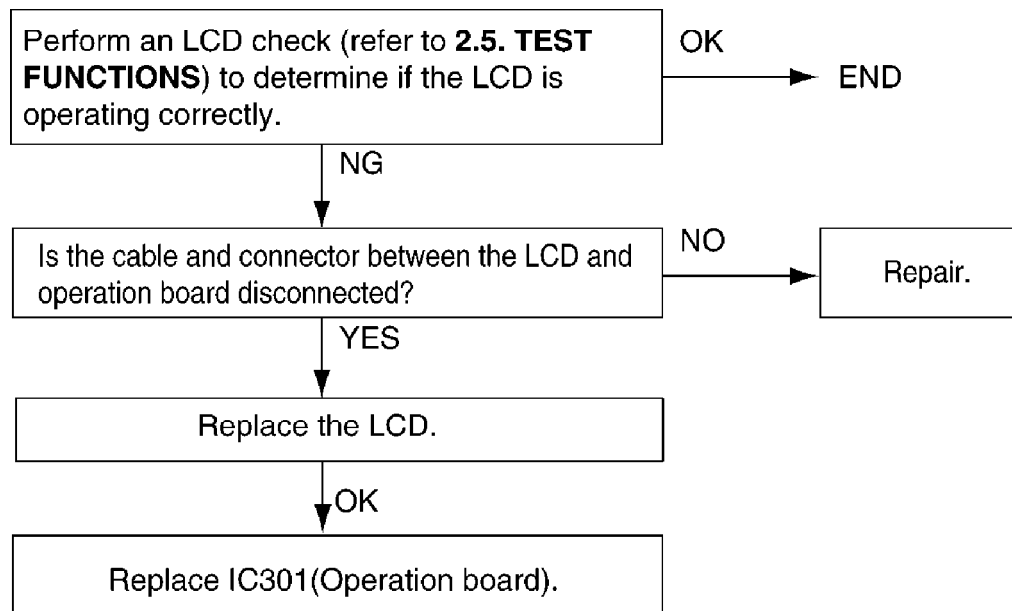

#### 2.3.3.7. Operation Panel Section

### 1. No key operation

## 2. No LCD indication

2.3.3.8. Sensor Board Section (Refer to 6.5. SENSORS AND SWITCHES for the circuit descriptions.)

The Test Function makes the sensor circuit check easier. (Refer to 2.5. TEST FUNCTIONS.) / For example, as for "COVER OPEN SENSOR", "CO" is turned ON/OFF on the display when you open or close the front cover. Also, document sensor, read position sensor, recording paper sensor and jam sensor are turned ON/OFF by the copy operation. Therefore, each sensor can be checked for proper mechanical operation. / As for the electric check, check whether each voltage is right or not with following flowchart turning each sensor lever ON/OFF manually.

### 1. Check the read position sensor (PS302)....."REMOVE DOCUMENT"

## 2. Check the document sensor (PI302)....."CHECK DOCUMENT"

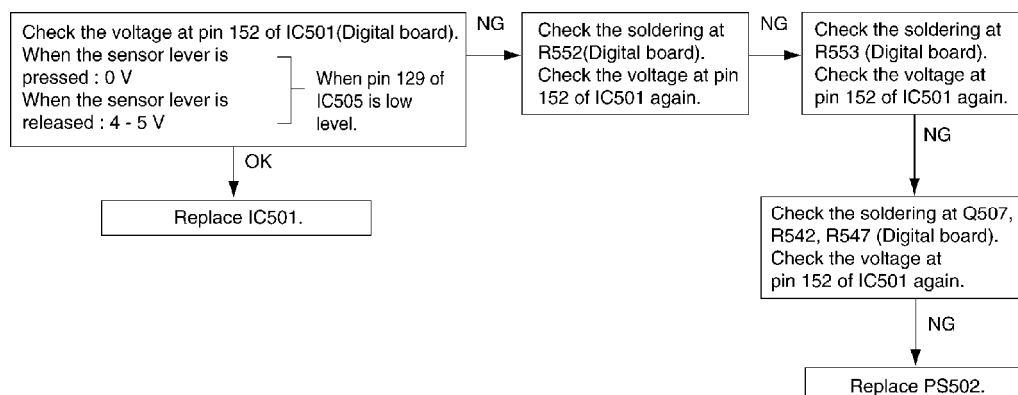

## 3. Check the cover open sensor (PI303)....."CHECK COVER"

## 4. Check the hook switch (SW401)

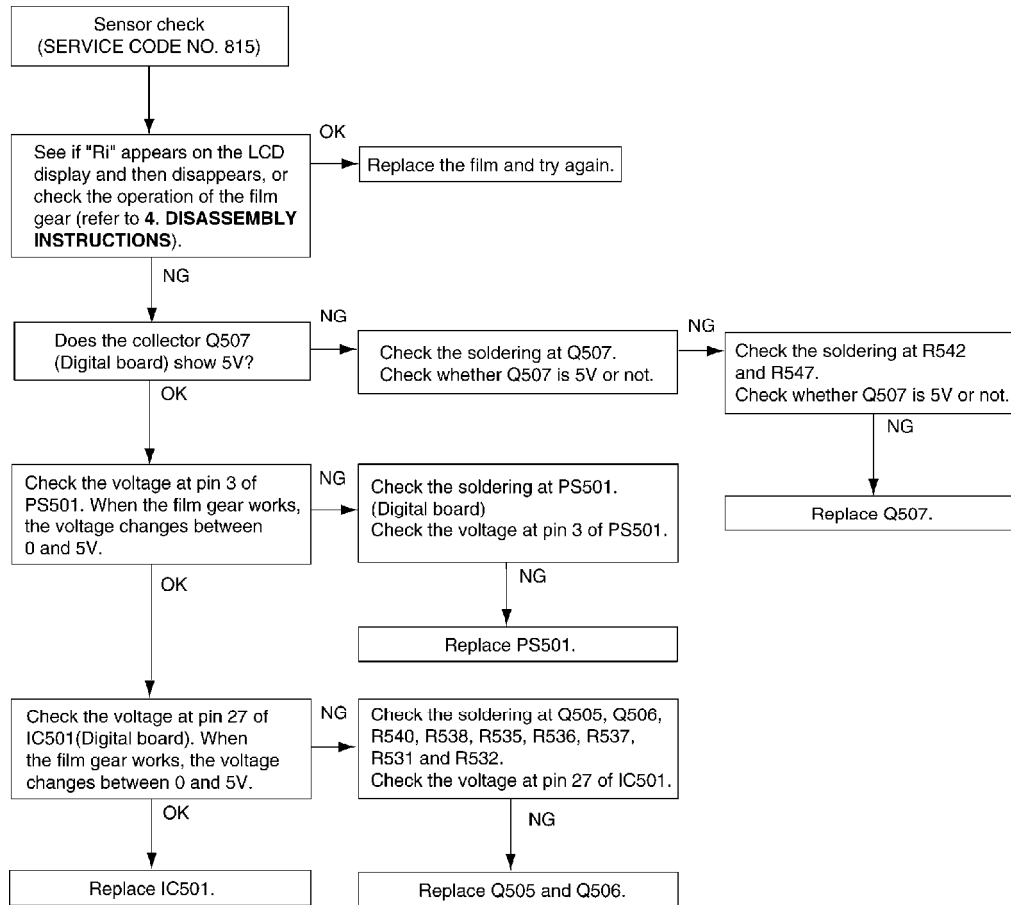

## 5. Check the paper top sensor (PS502)....."PAPER JAMMED"

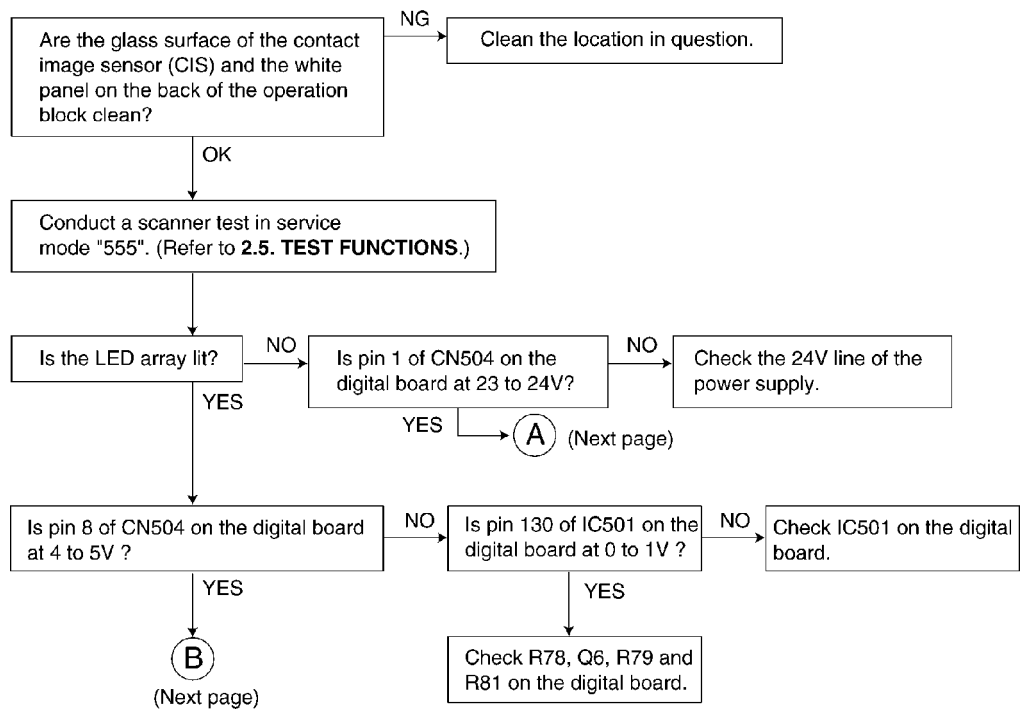

## 6. Check the film end sensor (PS501)....."FILM EMPTY"

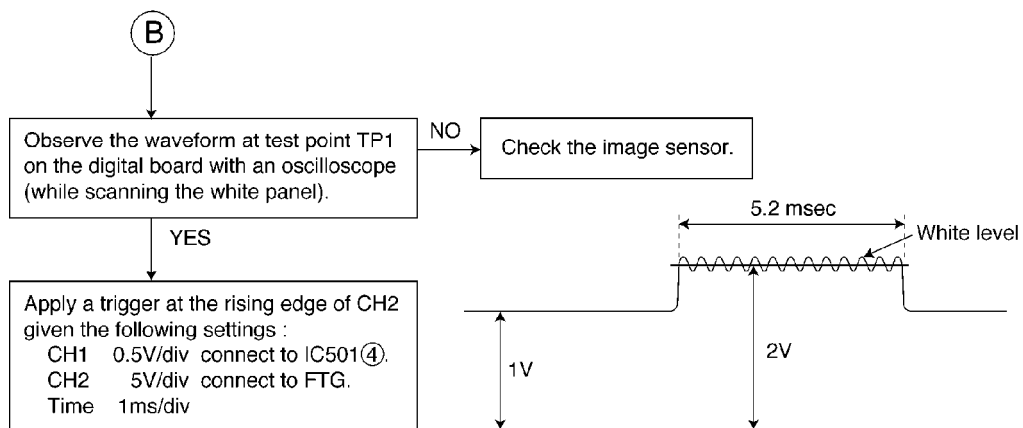

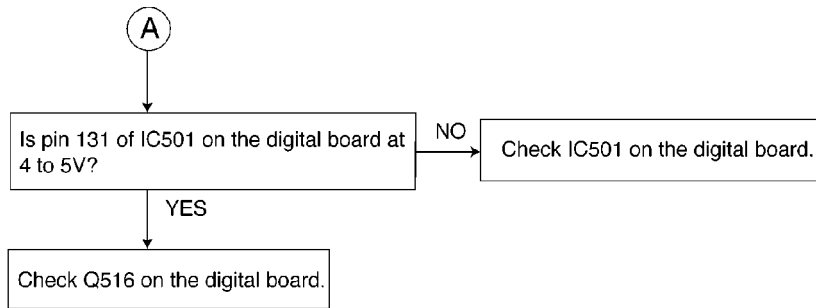

### 2.3.3.9. CIS (Contact Image Sensor) Section

Refer to 6.4.4. SCANNING BLOCK.

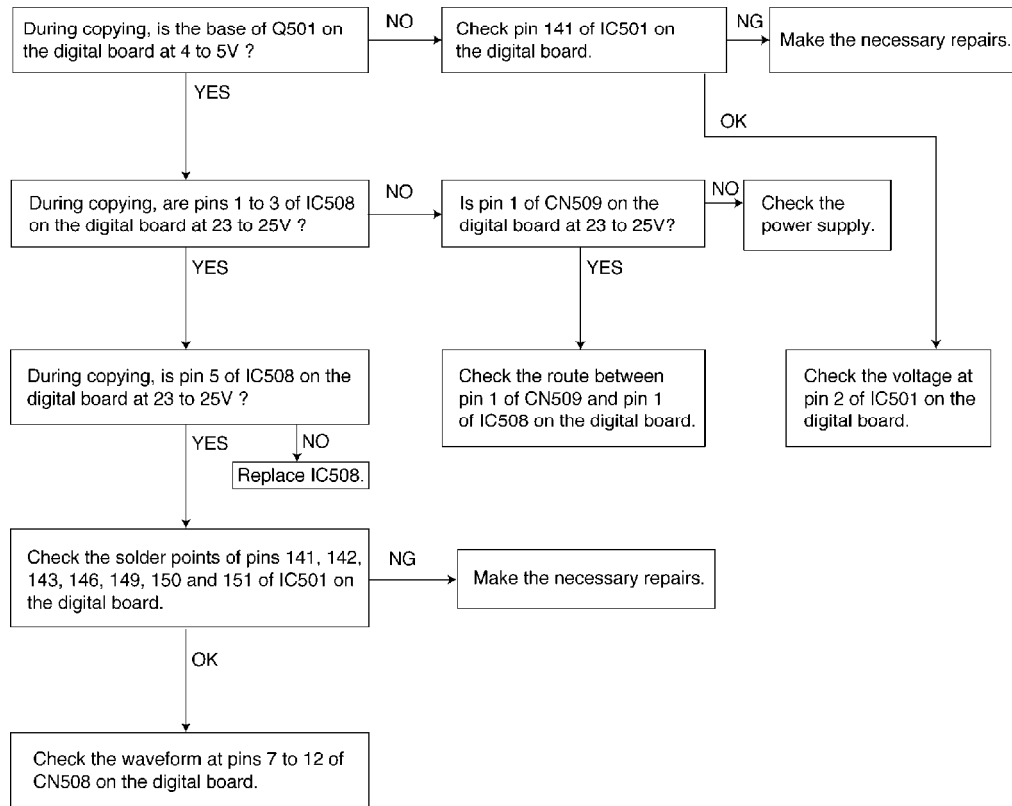

(Refer to 8.2. PRINTED CIRCUIT BOARD (DIGITAL BOARD FOR: PFUP1129Z).)  
2.3.3.10. Thermal Head Section (Refer to 6.4.3. THERMAL HEAD.)

## 2.4. PROGRAMMING AND LISTS

The programming functions are used to program the various features and functions of the machine, and to test the machine.

This facilitates communication between the user and the service man while programming the unit.

### 2.4.1. OPERATION

There are 2 basic categories of programming functions, the User Mode and the Service Mode. The Service Mode is further broken down into the normal and special programs. The normal programs are those listed in the Operating Instructions and are available to the user. The special programs are only those listed here and not displayed to the user. In both the User and Service Modes, there are Set Functions and Test Functions. The Set Functions are used to program various features and functions, and the Test Functions are used to test the various functions. The Set Functions are accessed by entering their code, changing the appropriate value, then pressing the SET key. The Test Functions are accessed by entering their code and pressing the key listed on the menu. While programming, to cancel any entry, press the STOP key.

### 2.4.2. OPERATION FLOW

【 ADVANCED FEATURE LIST 】

NO.	FEATURE	CURRENT SETTING
#22	JOURNAL AUTO PRINT	ON (ON, OFF)
#23	OVERSEAS MODE	OFF (ON, OFF)
#25	DELAYED TRANSMISSION	OFF (ON, OFF)
	DESTINATION =	
	START TIME = 12:00AM	
#26	AUTO CALLER ID LIST	ON (ON, OFF)
#30	SILENT FAX RECOGNITION RING	3 (3...6)
#31	RING DETECTION	OFF (OFF, A, B, C, D)
#36	RCU REDUCTION	92% (72, 86, 92, 100)
#39	LCD CONTRAST	NORMAL (NORMAL, DARKER)
#40	SILENT DETECTION	ON (ON, OFF)
#41	FAX ACTIVATION CODE	ON (ON, OFF)
	CODE = *9	
#44	MEMORY RECEIVE ALERT	ON (ON, OFF)
#46	FRIENDLY RECEPTION	ON (ON, OFF)
#49	AUTO DISCONNECT	ON (ON, OFF)
	CODE = *0	
#70	FAX PAGER CALL	OFF (ON, OFF)
	DESTINATION =	
#75	IG-FAX	OFF (ON, OFF)
#76	CONNECTING TONE	ON (ON, OFF)
#77	AUTO ANSWER MODE	FAX ONLY (FAX ONLY, TEL/FAX)
#78	TEL/FAX DELAYED RING	2 (1...4)
#79	FILM DETECTION	ON (ON, OFF)
#80	SET DEFAULT	Set Value

IF YOU HAVE A PROBLEM WITH YOUR FAX MACHINE, CALL TOLL-FREE 1-800-HELP-FAX (1-800-435-7329).

**Note:**

The above values are the default values.

## 2.4.4. SERVICE FUNCTION TABLE

Code	Function	Set Value	Effective Range	Default	Remarks
501	Pause time set	X 100 msec	001~600	50	
503	Dial speed select	1:10 pps 2:20 pps	1, 2	1	
511	Vox sense	1:High 2:Low	1, 2	1	When the TAM or TAM does not stop recording the ICM because noise is detected on the telephone line, change this setting to "LC"
520	CED frequency select	1:2100 Hz 2:1100 Hz	1, 2	1	See Symptom / / Countermeasure for long distance international calls 2.3.3.1. Defective Facsimile Section
521	International mode select	1:ON 2:OFF	1, 2	1	See Symptom / / Countermeasure for long distance international calls 2.3.3.1. Defective Facsimile Section

Code	Function	Set Value	Effective Range	Default	Remarks
522	Auto standby select	1:ON 2:OFF	1, 2	1	The resolution reverts to the default when transmission is complete.
523	Receive equalizer select	1:ON 2:OFF	1, 2	2	When the telephone station is far from the unit or reception cannot be performed correctly, adjust accordingly.
550	Memory clear: To reset the value to the default one, except the top margin (853) and left margin (854).				"START" input"
552	DTMF single tone test	1:ON 2:OFF	1, 2	2	See 2.5. TEST FUNCTIONS.
553	Monitor on FAX communication select	1: OFF 2:PHASE B 3:ALL	1~3	1	Sets whether to monitor the line status with the unit's speaker during FAX communication or not.
554	Modem test				See 2.5. TEST FUNCTIONS.
555	Scan check				See 2.5. TEST FUNCTIONS.
556	Motor test			0	See 2.5. TEST FUNCTIONS.
557	LED test				See 2.5. TEST FUNCTIONS.
558	LCD test				See 2.5. TEST FUNCTIONS.
559	Document jam detection select	1:ON 2:OFF	1, 2	1	See 2.2.1. Paper Jam
561	KEY test				See 2.5. TEST FUNCTIONS.
570	BREAK % select	1:61% 2:67%	1, 2	1	Sets the % break time for pulse dialing accordingly PBX.
571	ITS auto redial time set	X number of times	00~99	14	Selects the number of times that ITS is redialed (not including the first dial).
572	ITS auto redial line disconnection time set	X second	001~999	30	Sets the interval between redialing.

Code	Function	Set Value	Effective Range	Default	Remarks
573	Remote turn-on ring number set	X number of rings	01~99	15	Sets the number of rings before the unit starts to receive a document in the TEL mode.
590	FAX auto redial time set	X number of times	00~99	5	Selects the number of redial times during communication (including the first time).
591	FAX auto redial time disconnection time set	X second	001~999	45	Sets the FAX redial interval during FAX communication.
592	CNG transmit select	1: OFF 2:ALL 3: AUTO	1~3	2	Lets you select the CNG output during transmission. ALL: CNG is output at all times. A. AUTO: CNG is output only when automatic dialing is performed. OFF: CNG is not output at all times.
593	Time between CED and 300bps	1: 75 msec 2: 500 msec 3:1 sec	1~3	1	See Symptom/ / Countermeasure for long distance international calls 2.3.3.1. Defective Facsimile Section
594	Overseas DIS detection select	1: detects at the 1st time 2: detects at the 2st time	1, 2	1	See Symptom/ / Countermeasure for long distance international calls 2.3.3.1. Defective Facsimile Section
595	Receive error limit value set	X Number of times	001~999	100	Sets the number of acceptable error times when the FAX reconstructs the received data.
596	Transmit level set	X dBm	- 15~00	10	Selects the FAX transmission level.
598	Receiving sensitivity	43= -43 dBm	20~48	43	See (countermeasure C).
602	Warning LIST Printing	1:ON 2:OFF	1, 2	1	Used to print a call list when setting the TEL/FAX mode and detection.

Code	Function	Set Value	Effective Range	Default	Remarks
700	EXT. TAM OGM Rec. time	X second	01~99		Set the start time silent detection.
701	No voice detect time	X 100 msec	01~99		Sets the silent call confirmation detection time.
717	Transmit speed selection	1:9600BS 2: 7200BS 3: 4800BS 4: 2400BS	1~4	1	Adjusts the speed start training during FAX transmission
718	Receive speed selection	1:9600BS 2: 7200BS 3: 4800BS 4: 2400BS	1~4	1	Adjusts the speed start training during FAX reception.
719	Ringer off in TEL/FAX mode	1:ON 2:OFF	1, 2	1	Sets the ringer switch off when a call is received in the TEL or FAX mode.
721	Pause tone detect	1:ON 2:OFF	1, 2	1	Selects the tone detection for pause during dialing.
722	Redial tone detect	1:ON 2:OFF	1, 2	1	Selects the tone detection mode at redialing.
745	Power ON film feed	1:ON 2:OFF	1, 2	1	When the power is turned on, the film is wound to take up slack.
763	CNG detect time for friendly reception	1:10 sec 2:20 sec 3:30 sec	1~3	3	Selects the CNG detection time of friendly reception
771	T1 timer	1:35 sec 2:60 sec	1, 2	1	Sets a higher value when the response from the other party needs more time during FAX transmission.
815	Sensor & Vox check				See 2.5. TEST FUNCTIONS.
852	Print test pattern				See 2.5. TEST FUNCTIONS.
853	Top margin		1~9	-----	
854	Left margin		1~8	-----	
861	A4 size set	1:ON 2:OFF	1, 2	2	Used only at the factory.
880	History list				See 2.4.6. HISTORY

Code	Function	Set Value	Effective Range	Default	Remarks
890	TEL/FAX 1st ring back tone	1:ON 2:OFF	1, 2	1	Selects whether the TEL/FAX 1st ring back tone is ON or OFF in the TEL/FAX mode.

## 2.4.5. SERVICE MODE SETTINGS (Example of a printed out list)

```

【 SERVICE DATA LIST 】
Code      Set Value
501 PAUSE TIME      = 050*100ms      [(001...600)*100ms]
503 DIAL SPEED      = 10pps          [(1=10 2=20)pps]
520 CED FREQ.       = 2100Hz          [(1=2100 2=1100)Hz]
521 INTL. MODE      = ON              [(1=ON 2=OFF)]
522 AUTO STANDBY    = ON              [(1=ON 2=OFF)]
523 RX EQL.         = OFF             [(1=ON 2=OFF)]
700 EXT. TAM. OGM REC. TIME = 10sec          [(01...99)sec]
701 NO VOICE DETECT TIME = 50*100msec     [(01...99)*100msec]
853 TOP MARGIN      = 5              [(1...9)]
854 LEFT MARGIN     = 5              [(1...8)]

### Note:

The above values are the default values.

## 2.4.6. HISTORY

### Note:

See the following descriptions of this report. Item No. (1) ~ (49) are corresponding to the listed items in 2.4.6.1. Descriptions of the HISTORY Report.

### 2.4.6.1. Descriptions of the HISTORY Report

#### (1) ROM VERSION

EPROM version

#### (2) SUM

EPROM internal data calculation.

#### (3) YOUR LOGO

The user logo recorded in the unit. If it is not recorded, NONE will be displayed.

#### (4) YOUR TELEPHONE NUMBER

The user telephone number recorded in the unit. If it is not recorded, NONE will be displayed.

#### (5) FAX PAGER NUMBER

If you program a pager number into the unit, the pager number will be displayed here.

#### (6) FACTORY - CUSTOMER

This shows how many days from factory production until the user turns ON the unit.

**(7) MONTH**

The shows the very first month, date, year and time set by the user after they purchased the unit.

**(8) DAY**

The shows the very first month, date, year and time set by the user after they purchased the unit.

**(9) YEAR**

The shows the very first month, date, year and time set by the user after they purchased the unit.

**(10) TIME**

The shows the very first month, date, year and time set by the user after they purchased the unit.

**(11) USAGE TIME**

The amount of time the unit has been powered ON.

**(12) FACTORY - NOW**

This shows how many days from factory production until the user prints out this history list.

**(13) TEL MODE**

The amount of time the TEL mode setting was used.

**(14) FAX MODE**

The amount of time the FAX mode setting was used.

**(15) TEL/FAX MODE**

The amount of time the TEL/FAX mode setting was used.

**(16) ANS/FAX MODE**

The amount of time the ANS/FAX mode setting was used.

**(17) FINAL RECEIVE MODE**

The last set receiving mode by the user.

**(18) TONE/PULSE SELECTION**

The most recently used setting used, either TONE or PULSE.

**(19) RECEIVE REDUCTION**

The compression rate when receiving.

**(20) SETTING NO. OF DIRECTORY**

The recorded directory stations (one touch and JOG DIAL).

**(21) NUMBER OF COPY**

The number of pages copied.

**(22) NUMBER OF RECEIVE**

The number of pages received.

**(23) NUMBER OF SENDING**

The number of pages sent.

**(24) NUMBER OF CALLER ID**

The number of times Caller ID was received.

**(25) NUMBER OF RECORDING MESSAGE**

The number of messages recorded in TAM.

**(26) NUMBER OF PC SCAN**

The number of times multifunction was used for the Scanner. (The number of pages scanned. If the unit does not have a PC interface, NONE will be printed.)

**(27) NUMBER OF PC-PRINT**

The number of times multifunction was used for the Printer. (The number of pages printed. If the unit does not have a PC interface, NONE will be printed.)

**(28) NUMBER OF RECEIVING TO PC**

The number of times received in the PC through the FAX serial interface (RS232C). (The number of pages received. If the unit does not have a PC interface, NONE will be printed.)

**(29) NUMBER OF SENDING FROM PC**

The number of times transmitted from the PC through the FAX serial interface (RS232C). (The

number of pages transmitted. If the unit does not have a PC interface, NONE will be printed.)

**(30) NUMBER OF PRINTING WARNING LIST**

The number of warning lists printed until now.

**(31) NUMBER OF PRINTING HELP**

The number of help lists printed until now.

**(32) NUMBER OF DIVIDED PRINTING IN FAX RECEPTION**

The number of faxes received that were divided into more than one sheet since the unit was purchased.

**(33) DETECTION OF RS232C**

When the fax and PC serial cable (RS232C) are connected and the signal is received correctly, COMPLETE will be printed. For models without a PC interface or when there is a PC interface but the signal cannot be received between the fax and PC, INCOMPLETE will be printed. (The number of pages transmitted. If the unit does not have a PC interface, NONE will be printed.)

**(34) NO. OF IQ-FAX LOADING -OK:**

**(35) NO. OF IQ-FAX LOADING -NG:**

You may not be able to use IQ-FAX if the special subscriber information is not loaded from the IQ-FAX center before use. Depending on the conditions of the communication line, it may not be completed in one time, so RETRIED will be performed. The number of OK and NG IQ-FAX loadings will be printed.

**(36) FAX MODE**

Means the unit received a fax message in the FAX mode.

**(37) MAN RCV**

Means the unit received a fax message by manual operation.

**(38) FRN RCV**

Means the unit received a fax message by friendly signal detection.

**(39) VOX**

Means the unit detected silence or no voice.

**(40) RMT DTMF**

Means the unit detected DTMF (Remote Fax activation code) entered remotely.

**(41) PAL DTMF**

Means the unit detected DTMF (Remote Fax activation code) entered by a parallel connected telephone.

**(42) TURN-ON**

Means the unit started to receive after 15 rings. (Remote Turn On: Service Code #573)

**(43) TIME OUT**

Means the unit started to receive after Ring Time Out in the EXT-TAM or TEL/FAX mode.

**(44) IDENT**

Means the unit detected Ring Detection.

**(45) CNG OGM**

Means the unit detected the CNG while it was sending the Dummy Ring Back Tone in the TEL/FAX mode, or while answering a call in the EXT-TAM mode. Or means the unit detected the CNG while it was sending the OGM in the ANS/FAX mode.

**(46) CNG ICM**

Means the unit detected the CNG while it was recording the ICM in the ANS/FAX mode.

**(47) KEY OPERATION -1st 50:**

**(48) KEY OPERATION -Last 50:**

Indicates 2-digit codes. Refer to 2.5.2. BUTTON CODE TABLE.

**- 1st 50:**

**History of the first 50 key operations after purchase.**

(Ex.) If the MENU, # and 9 buttons are pressed, 20, 3C and 39 will be printed.

- Last 50:

History of the last 50 key operations.

(49) NUMBER OF IQ-FAX PAGES TRANSMITTED

## 2.4.7. SPECIAL SERVICE JOURNAL REPORTS

Journal 2 and Journal 3 shown below, which are special journals giving the additional detailed information about the latest 35 communications, can be printed by Service Code 881 or 882. Remote printing function for the journal reports (JOURNAL, JOURNAL 2 and JOURNAL 3) is also available for service technicians. (Refer to 2.3.3.3.2. Remote programming.) The JOURNAL report only gives you basic information about a communication, but the other two journal reports provide different information on the same item (communication).

**JOURNAL**

Mar. 23 1998 09:51PM

NO.	OTHER FACSIMILE	START TIME	USAGE TIME	MODE	PAGES	RESULT	*CODE

Mar. 23 1998 09:51AM

NO.	(6) ENCODE	(7) MSLT	(8) EQM (RX)	(9) ERROR LINE (RX)	(10) MAKER CODE
01	MH	20msec	0000	00000	79
02	MH	20msec	0000	00000	00
03	MR	20msec	1200	00013	00
04	MR	20msec	0000	00000	00

HOW TO READ JOURNAL REPORTS:

Example:

1. Look at NO. 01 in the JOURNAL. If you want to know about the details about that item, see NO. 01 in the JOURNAL 2 and the JOURNAL 3. You can get the following information.

\* MODE: Fax transmission / \* RCV. MODE: TEL / \* TX SPEED: 9.6 kbps / \* RESOLUTION: standard / \* ENCODE: MH / \* MAKER CODE:

## 2. Look at NO. 04 in the JOURNAL 2. CNG (0003) indicates that the CNG signal has been received three times since the purchase date.

For further details, see 2.4.7.1. JOURNAL 2 and 2.4.7.2. JOURNAL 3.

2.4.7.1. JOURNAL 2 (Refer to JOURNAL 2 in 2.4.7.3. PRINTOUT EXAMPLE.)

Journal 2 displays the additional detailed information about the last 35 communications.

Descriptions:

### (1) RCV. MODE

Indicates which receive mode the unit was in when the unit received a fax message.

This information is also displayed when the unit transmitted a fax message.

### (2) SPEED

Indicates the speed of the communication. If multiple pages are transmitted or received, it indicates the last page's communication speed. If there is a communication error, "?" is displayed.

### (3) RESOLUTION

Indicates the resolution of the communication. If multiple pages are transmitted or received, it indicates the last page's resolution. If there is a communication error, "?" is displayed.

### (4) RCV-TRIG. (CNT.)

Indicates the trigger that causes the unit to switch to the fax receive mode. The available options are listed in JOURNAL 2 in 2.4.7.3. PRINTOUT EXAMPLE. The values in parentheses indicate how many times the trigger has been used. (For example, "0003" means three times.)

No.	Display	Function
1	FAX MODE	Means the unit received a fax message in the FAX mode.
2	MAN RCV	Means the unit received a fax message by manual operation.
3	FRN RCV	Means the unit received a fax message by friendly signal detection.
4	VOX	Means the unit detected silence or no voice.
5	RMT DTMF	Means the unit detected DTMF (Remote Fax activation code) entered remotely.
6	PAL DTMF	Means the unit detected DTMF (Remote Fax activation code) entered by a parallel connected telephone.
7	TURN-ON	Means the unit started to receive after 15 rings. (Remote Turn On: Service Code #573)
8	TIME OUT	Means the unit started to receive after Ring Time Out in the EXT-TAM or TEL/FAX mode.
9	IDENT	Means the unit detected Ring Detection.
10	CNG OGM	Means the unit detected the CNG while it was sending the Dummy Ring Back Tone in the TEL/FAX mode. / OR / Means the unit detected the CNG while it was sending the OGM in the ANS/FAX mode.
11	CNG ICM	Means the unit detected the CNG while it was recording the ICM in the ANS/FAX mode.

### (5) ERROR → MEMORY

Indicates the reason why the unit received a fax message in memory.

If you look at No.11 in the JOURNAL 2 in 2.4.7.3. PRINTOUT EXAMPLE, it shows the fax message was received in memory due to "PAPER OUT" error.

[NO RESPONSE DISAPPEARED ON JOURNAL]

The "NO RESPONSE DISAPPEARED ON JOURNAL" displays the information about the last 10 communications terminated by "No Response". (Some of the communications terminated by "No Response" were not displayed in the JOURNAL.)

When a fax transmission cannot be performed because the other party's unit is set to the TEL mode, "No response" will be printed.

2.4.7.2. JOURNAL 3 (Refer to JOURNAL 3 in 2.4.7.3. PRINTOUT EXAMPLE.)

Descriptions:

(6) ENCODE

Compression Code : MH/MR

(7) MSLT

MSLT means Minimum Scan Line Time. Used only at the factory.

(8) EQM

EQM means Eye Quality Monitor. Used only at the factory.

(9) ERROR LINE(RX)

When an error occurs while receiving a fax, this shows the number of error lines.

(10) MAKER CODE

This shows a 2 digit code of the other party's fax machine brand.

0E: "KX" model

00: Unknown

79: "UF" model

19: "Zerex" model

## 2.5. TEST FUNCTIONS

The codes listed below can be used to perform simple checks of some of the unit's functions. When complaints are received from customers, they provide an effective tool for identifying the locations and causes of malfunctions.

Test mode	Type of Mode	Code <input type="text"/> <input type="text"/> <input type="text"/>	Function
		Operation after code input	
MOTOR TEST	Service Mode	<input type="text"/> 5 <input type="text"/> 5 <input type="text"/> 6	Rotates the transmission and reception motor to check the operation of the motor.  13 ... FAX TX/Reading memory 14 ... Document feed 23 ... Recording paper is fed 33 ... List/FAX RX print, pull back recording paper 43 ... Copy  05 ... Recording paper feed (Test a recording paper feeding operation by shifting from 23 to 33.)  • Press the STOP button to quit.
		START	
MODEM TEST	Service Mode	<input type="text"/> 5 <input type="text"/> 5 <input type="text"/> 4	First, go to the OFF-HOOK status with the handset to enter this Test Mode. Each time you press the start key, each of the signals will be heard in the following order from the handset. 1) OFF                      2) 9600bps                      3) 7200bps 4) 4800bps                      5) 2400bps                      6) 300bps 7) 2100Hz                      8) 1100Hz
		START	
ROM CHECK	Service Mode	<input type="text"/> 5 <input type="text"/> 5 <input type="text"/> 1	Indicates the version and check sum of the ROM.
		START	
SCAN CHECK	Service Mode	<input type="text"/> 5 <input type="text"/> 5 <input type="text"/> 5	Turns on the LEDs of the CIS and operates the read system.
		START	
LCD CHECK	Service Mode	<input type="text"/> 5 <input type="text"/> 5 <input type="text"/> 8	Checks the LCD indication. Illuminates all the dots to check if they are normal.
		START	
DTMF SINGLE TEST	Service Mode	<input type="text"/> 5 <input type="text"/> 5 <input type="text"/> 2	Outputs DTMF as single tones. Used to check the frequencies of the individual DTMF tones. Refer to <b>2.5.1. DTMF Single Tone Transmit Select</b> .
		1..On 2..Off	
LED TEST	Service Mode	<input type="text"/> 5 <input type="text"/> 5 <input type="text"/> 7	All LEDs above the operation panel board flash on and off, or are illuminated.
		START	
KEY CHECK	Service Mode	<input type="text"/> 5 <input type="text"/> 6 <input type="text"/> 1	Checks the button operation. Indicates the button code on the LCD while the button is pressed. Refer to <b>2.5.2. Button Code Table</b> .
		START {any key}	
FACTORY SET	Service Mode	<input type="text"/> 5 <input type="text"/> 5 <input type="text"/> 0	Clears the memory where the user can store data.
		START	
PRINT TEST PATTERN	Service Mode	<input type="text"/> 8 <input type="text"/> 5 <input type="text"/> 2	Prints out the test pattern. Used mainly at the factory to test the print quality. You can select 1~4. (See <b>2.5.3. PRINT TEST PATTERN</b> .)
		START	

Test mode	Type of Mode	Code <input type="text"/> <input type="text"/> <input type="text"/>	Function
		Operation after code input	
SENSOR CHECK & VOX CHECK	Service Mode	<input type="text"/> 8 <input type="text"/> 1 <input type="text"/> 5	If you enter this mode and operate sensor levers with your hands, the LCD display of the related sensor (or switch) turns ON/OFF. Also, when copying a document, the related sensor will turn ON/OFF. (Do, Sn, Pl, Pt, Ri) For each sensor's operation, refer to <b>6.5. SENSORS AND SWITCHES</b> .
		START	
		LCD display <input type="text"/> Do <input type="text"/> Sn <input type="text"/> Co <input type="text"/> Pt <input type="text"/> Ri <input type="text"/> Vx <input type="text"/>	
		Do: Document set sensor: Paper inserted. Turns on when a document is inserted. Sn: Read position sensor: At the read position. Turns on when the front cover is opened and the sensor lever is pressed directly. Co: Cover open sensor: Cover open. Turns on and off when the front cover is opened and closed. Pt: Paper top sensor: Sensor on. Turns on when the front cover is opened and the sensor lever is pressed directly. Ri: Film and sensor: Sensor on. Turns on and off when the film end sensor gear turns around. Vx: Vox signal: Detection signal for the tone on the line. Turns on when there is a tone signal on the line.	

**Note:** The numbers in the boxes (XXX) indicate the keys to be input for the various test modes.

### 2.5.1. DTMF SINGLE TONE TRANSMIT SELECTION

When set to ON (=1), the 12 keys and transmission frequencies are as shown.

key	High Frequency (Hz)	Key	Low Frequency (Hz)
"1"	697	"5"	1209
"2"	770	"6"	1336
"3"	852	"7"	1477
"4"	941	"8"	1633

When set to OFF (=2), the 12 keys and transmission frequencies are as shown.

Low (Hz) \ High (Hz)	High (Hz)		
	1209	1336	1477
697	"1"	"2"	"3"
770	"4"	"5"	"6"
852	"7"	"8"	"9"
941	✕	"0"	"#"

**Note:** After performing this check, do not forget to turn the setting off.  
Otherwise, dialing in DTMF signal will not work.

## 2.5.2. BUTTON CODE TABLE

Code	Button Name	Code	Button Name	Code	Button Name
02	RESOLUTION	31	1	3D	REDIAL/PAUSE
04	START/COPY/SET	32	2	47	CALLER ID SEARCH
05	LOWER	33	3	48	IQ-FAX
08	MONITOR	34	4	49	QUICK SCAN
0A	MUTE	35	5	64	STATION 1
0C	RECEIVE MODE	36	6	65	STATION 2
20	MENU	37	7	66	STATION 3
22	HELP	38	8	1E	JOG (RIGHT)
24	DIRECTORY	39	9	1F	JOG (LEFT)
25	▲ VOLUME	3A	0	00	NO INPUT
26	▼ VOLUME	3B	✕	01	STOP
		3C	#		

**Note:**

These codes (00, 01) are only for the data in the History Report.

## 2.5.3. PRINT TEST PATTERN

### 1. Platen roller

(Reference pattern)

about  
1 cm

## 2. Left margin/Top margin

(Reference pattern)

### 3. Thermal head 1 dot

(Reference pattern)

4. Use this test pattern to confirm the torque limiter for Ink film and platen roller timing.

(Reference pattern)

### 3. ADJUSTMENTS

No.	Test Equipment and Jig Name	Jig No.
1	Oscilloscope	-----
2	Extension Cord	PQZZ2K12Z, PQZZ8K18Z

### **3.2. ADJUSTING THE FEEDER PRESSURE**

If misfeeding of a document such as multiple feeding or no feeding occurs frequently, try to adjust the feeder pressure by following the steps below.

- 1. Slide the cover open lever forwards to open the front cover.**
- 2. Shift the position of the lever by using an instrument with a pointed end like a clip or a ball-point pen.**
  - Position A: Select this position when documents are not fed.**
  - Position B: Standard position (pre-selected)**
  - Position C: Select this position when documents are multiple-fed.**
- 3. Close the front cover securely by pushing down on both ends.**

### **3.3. CONFIRMING THE SEPARATION SPRING**

- 1. Open the front cover.**
- 2. Check the highest level of the separation spring with the spring height tool. Please make sure that the separation spring does not touch the tool during this operation. (Both right and left) (See Fig. 1.)**

**Note:**

**Be careful not to bend the separation spring.**

**Fig. 1**

### **3.4. DOCUMENT READ START POSITION ADJUSTMENT**

- 1. Connect the AC cord.**
- 2. Copy the document and confirm the read start position of the document. Compare the printout (copy) with the original document.**
- 3. If out of position, adjust the read position.**
- 4. Press the MENU button.**
- 5. Press the #, 9, 0, 0, 0, and 5, 6, 3 buttons.**
- 6. Press the ■ , ■ , SET and MENU buttons.**

The read start position moves 1 mm in an increment.

## 4. DISASSEMBLY INSTRUCTIONS

### 5. HOW TO REPLACE THE FLAT PACKAGE IC

Even if you do not have the special tools (for example, a spot heater) to remove the Flat IC, with some solder (large amount), a soldering iron and a cutter knife, you can easily remove the ICs that have more than 100 pins.

#### 5.1. PREPARATION

##### - SOLDER

Sparkle Solder 115A-1, 115B-1 OR Almit Solder KR-19, KR-19RMA

##### - Soldering iron

Recommended power consumption is between 30 W to 40 W. /  
Temperature of Copper Rod  $662 \pm 50^{\circ}\text{F}$  ( $350 \pm 10^{\circ}\text{C}$ ) / (An expert may handle a 60~80 W iron, but a beginner might damage the foil by overheating.)

##### - Flux / HI115 Specific gravity 0.863 / (Original flux should be replaced daily.)

#### 5.2. FLAT PACKAGE IC REMOVAL PROCEDURE

1. Put plenty of solder on the IC pins so that the pins can be completely covered.

**Note:**

If the IC pins are not soldered enough, you may give pressure to the P.C. board when cutting the pins with a cutter.

2. Make a few cuts into the joint (between the IC and its pins) first and then cut off the pins thoroughly.

3. While the solder melts, remove it together with the IC pins.

When you attach a new IC to the board, remove all solder left on the land with some tools like a soldering wire. If some solder is left at the joint on the board, the new IC will not be attached properly.

### 5.3. FLAT PACKAGE IC INSTALLATION PROCEDURE

1. Temporarily fix the FLAT PACKAGE IC, soldering the two marked pins.

● - - - - - Temporary soldering point.

\*Check the accuracy of the IC setting with the corresponding soldering foil.

2. Apply flux to all pins of the FLAT PACKAGE IC.

3. Solder the pins, sliding the soldering iron in the direction of the arrow.

#### 5.4. BRIDGE MODIFICATION PROCEDURE

1. Lightly resolder the bridged portion.
2. Remove the remaining solder along the pins using a soldering iron as shown in the figure below.

## 6. CIRCUIT OPERATIONS

### 6.1. CONNECTION DIAGRAM

### 6.2. GENERAL BLOCK DIAGRAM

The following is an outline of each device IC on the digital board. (Refer to 6.2.1. General Block Diagram.).

#### 1. ASIC (IC501)

Composed mainly of an address decoder and a modem control.  
Controls the general FAX operations.

Controls the operation panel I/F.  
Controls the thermal head I/F and CIS I/F.  
Performs the image processing.  
CPU and Real time clock  
Provides the reset pulse for each of the major ICs.

**2. ROM (IC502)**

Contains all of the program instructions on the unit operations.

**3. Static RAM (IC504)**

This memory is used mainly for the parameter working in the storage area.

**4. Dynamic RAM (IC503)**

This memory is used mainly for the parameter working in the storage area.

**5. MODEM (IC505)**

Performs the modulation and the demodulation for FAX communication.

**6. Read Section**

CIS image sensor to read transmitted documents.

**7. Motor Driver (IC506)**

Drives the transmission motor and the reception motor.

**8. Thermal Head**

Contains heat-emitting elements for dot matrix image printing.

**9. Analog Board**

Composed of ITS circuit and NCU circuit.

**10. Sensor Section**

Composed of a cover open sensor, a document sensor, a read position sensor, a paper top sensor and a film end sensor.

**11. Power Supply Board Switching Section**

Supplies +5V and +24V to the unit.

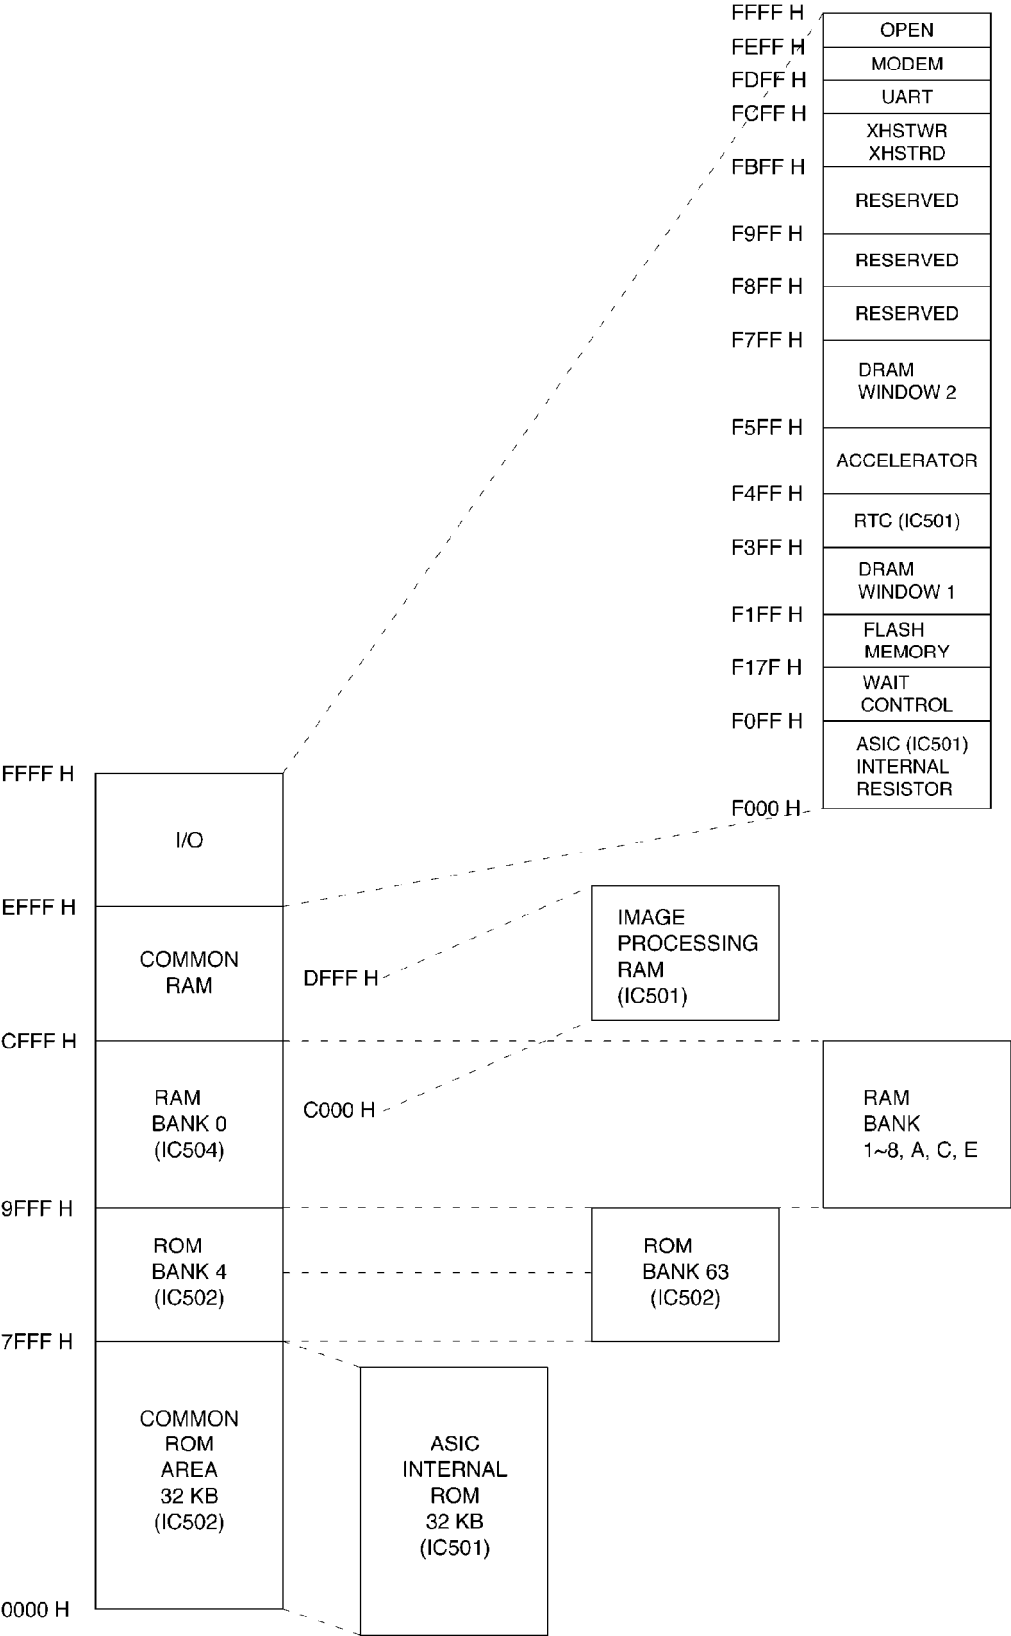

**6.2.1. General Block Diagram**

**6.3. CONTROL SECTION**

**6.3.1. BLOCK DIAGRAM**

6.3.2. MEMORY MAP

6.3.3. ASIC (IC501)

This custom IC is used for the general FAX operations.

**1. CPU:**

This model uses a Z80 equivalent to the CPU operating at 8 MHz. Most of the peripheral functions are performed by custom-designed LSIs. Therefore, the CPU only works for processing the results.

**2. RTC:**

Real Time Clock

**3. DECODER:**

Decodes the address.

**4. ROM/RAM I/F:**

Controls the SELECT signal of ROM or RAM and the bank switching.

**5. CIS I/F:**

Controls the document reading.

**6. IMAGE DATA RAM:**

This memory is programmed into the ASIC and uses 8 KB for the image processing. (See Fig. A.\*)

**7. THERMAL HEAD I/F:**

Transmits the recorded data to the thermal head.

**8. MOTOR I/F:**

Controls the transmission motor which feeds the document.

Controls the receiving motor which feeds the recording paper.

**9. OPERATION PANEL I/F:**

Serial interface with Operation Panel.

**10. I/O PORT:**

I/O Port Interface.

**11. ANALOG UNIT:**

Electronic volume for the handset and the monitor.

Sends beep tones, etc.

## (CPU ADDRESS)

**Note\*:**

This memory is incorporated into the ASIC (IC501) and used for the image processing.  
Fig. A shows the memory map of the Image Data RAM.

### 6.3.4. ROM (IC502)

This 512KB ROM (EPROM or MASKROM) carries a common area of 32KB and bank areas which each have 8KB (BK4~BK63). The addresses from 0000H to 7FFFH are for the common area and from 8000H to 9FFFH are for the bank areas.

### 6.3.5. STATIC RAM (IC504)

This 32KB RAM carries a common area of 8KB and bank areas which each have 12KB. The addresses from 0000H to EFFFH are for the common area and from A000H to CFFFH are for the bank area.

### 6.3.6. DYNAMIC RAM (IC503)

The DRAM serves as CPU and receives memory.

The address is F200H~F3FFH (DRAM access window 1) and F600H~F7FFH (DRAM access window 2).

#### Descriptions of Pin Distribution (IC501)

### 6.3.7. RESET CIRCUIT (WATCH DOG TIMER)

The output signal from pin 1 of the voltage detect IC (IC509) is input to the ASIC (IC501) 136 pin. Then the output signal from pin 133 of the ASIC (IC501) resets the ASIC.

#### Circuit Diagram

1. During a momentary power interruption, a positive reset pulse of 46~51 msec is generated and the system is reset completely.

2. When pin 132 and 133 of IC501 become low level, they will prohibit the SRAM (IC504) from changing data.

The SRAM (IC504) will go into the backup mode, when they are backed up by a lithium battery.

3. The watch dog timer, built-in the ASIC (IC501), is initialized by the CPU about every 1.5 ms.

When a watch dog error occurs, pin 137 of the ASIC (IC501) becomes low level.

The terminal of the **WDERR** signal is connected to the reset line, so the **WDERR** signal works as the reset signal.

#### 6.3.8. SRAM AND RTC BACKUP CIRCUIT

##### 1. Function

This unit has a lithium battery (BATT) which works for the SRAM (IC504) and Real Time Clock IC (RTC: inside IC501).

The user parameters for autodial numbers, the system setup data and others are stored in the SRAM (IC504).

The RTC continues to work, backed up by a lithium battery even when the power switch is OFF.

##### 2. SRAM (IC504) Backup Circuit Operation

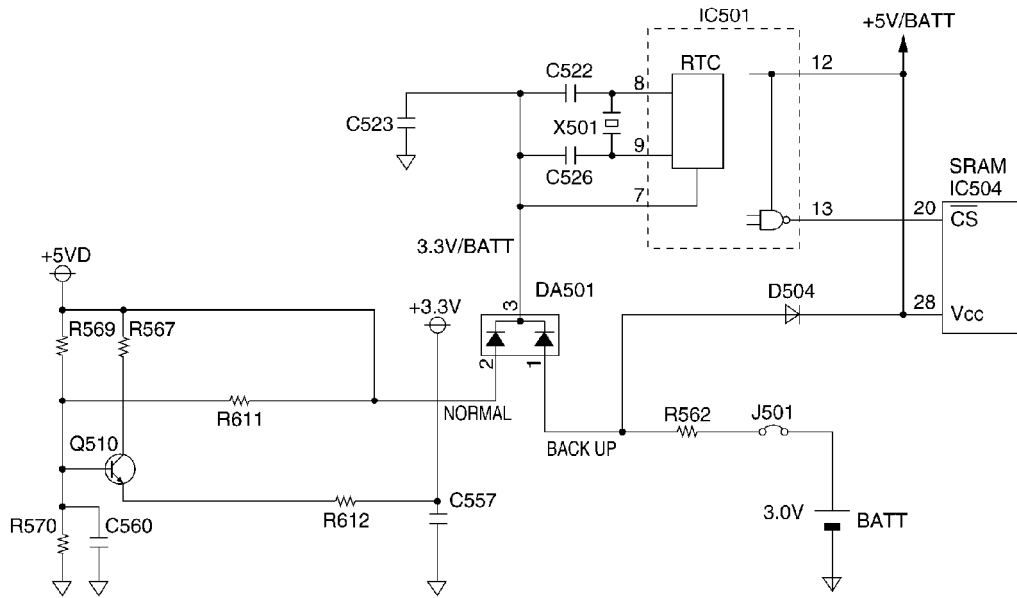

When the power switch is turned ON, power is supplied through pin 12 of IC501 to the SRAM (IC504). At this time, the voltage at pin 28 of the SRAM is 5V. When the power switch is turned OFF, the BATT supplies power to the SRAM through J501, R562 and D504. The voltage at pin 28 of the SRAM is about +2.5V. When the power switch is OFF and the voltage of +5V decreases, the voltage detect IC (IC509) outputs "Low " level and the IC501 outputs the reset signal. Pin 28 of the SRAM becomes roughly the same voltage as the battery voltage. At this point, pin 20 (CS) of IC504 becomes high level, causing the SRAM to go into the backup mode, in which the power consumption is lower.

##### 3. RTC Inside (IC501) Backup Circuit Operation

When the power switch is turned ON, power is supplied through DA501 to the RTC (inside IC501). At this time, the voltage at pin 7 of the IC501 is +3.3V. When the power switch is turned OFF, the BATT supplies power to RTC through DA501. The voltage at pin 7 of IC501 is about +2.5V. When the power switch is OFF and the voltage of +3.3V decreases, pin 7 of RTC (IC501) becomes roughly the same voltage as the battery voltage. RTC goes into the backup mode, in which the power consumption is lower.

### Circuit Diagram

### 6.3.9. SUPERVISION CIRCUIT FOR THE THERMAL HEAD TEMPERATURE

## 1. Function

**The thermistor changes the resistor according to the temperature and uses the thermistor's characteristics. The output of pin 169 of IC501 becomes a low level. Then when it becomes a high level, it**

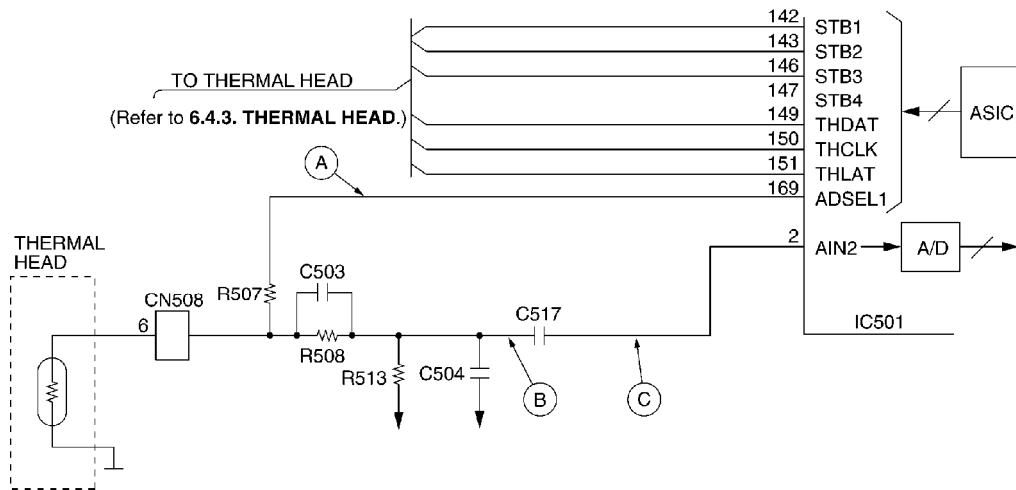

triggers point **(A)**. In point **(C)**, according to the voltage output time, the thermal head's temperature is detected.

**B**

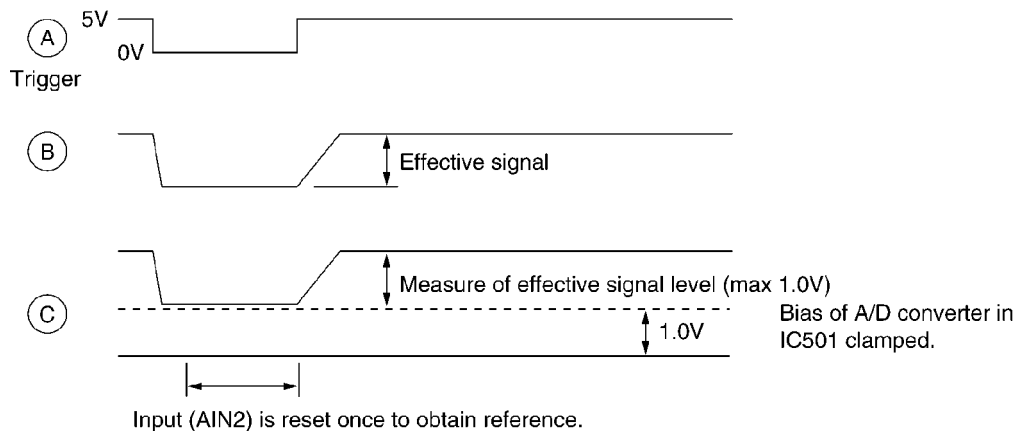

After the thermal head temperature is converted to voltage in **B**, it is then changed to digital data in the A/D converter inside IC501. The CPU decides the strobe width of the thermal head according to this value. Therefore, this circuit can keep the thermal head at an even temperature in order to stabilize the printing density and prevent the head from being overheated.

Circuit Diagram

Timing Chart

## 6.4. FACSIMILE SECTION

### 6.4.1. IMAGE DATA FLOW DURING FACSIMILE OPERATION

COPY (Fine, Super-Fine, Half Tone)

1. Line information is read by CIS (to be used as the reference white level) via route ①, and is input to IC501. Refer to 6.4.2. Block Diagram.
2. In IC501, the data is adjusted to a suitable level for A/D conversion in the Analog Signal Processing Section, and via route ② it is input to A/D conversion (8 bit). After finishing A/D conversion, the data is input to the Image Processing Section via route ③. Then

- via routes ④ and ⑤, it is stored in RAM as shading data.
3. The draft's information that is read by CIS is input to IC501 via route ①. After it is adjusted to a suitable level for A/D conversion via route ②, the draft's information is converted to A/D (8 bit), and it is input to the Image Processing Section. The other side, the shading data which flows from RAM via routes ⑥ and ⑦, is input to the Image Processing Section. After finishing the draft's information image processing, white is regarded as "0" and black is regarded as "1". Then via routes ④ and ⑤, they are stored in RAM.
4. The white/black data stored as above via routes ⑥ and ⑧ is input to the P/S converter. The white/black data converted to serial data in the P/S converter is input to the Thermal Head via route ⑨ and is printed out on recording paper.

**Note:**

Standard : Reads 3.58 times/mm

Fine : Reads 7.7 times/mm

Super-Fine : Reads 15.4 times/mm

**Transmission**

1. Same processing as COPY items 1 - 3.
2. The data stored in the RAM of IC501 is output from IC501 via routes ⑥ and ⑩, and is stored in the system bus.

Via route ⑪, it is stored in the communication buffer inside DRAM (IC503).

3. While retrieving data stored in the communication buffer synchronous with the modem, the CPU (inside IC501) inputs the data to the modem along route ⑫, where it is converted to serial analog data and forwarded over the telephone lines via the NCU Section.

#### Reception

1. The serial analog image data is received over the telephone lines and input to the modem via the NCU section, where it is demodulated to parallel digital data. Then the CPU (IC501) stores the data in the communication buffer DRAM (IC503) along route ⑫.
2. The data stored in DRAM (IC503) is decoded by the CPU (IC501) via route ⑫, and is stored in DRAM (IC503) via routes ⑬ and ⑤.
3. Same processing as COPY item 4.

#### 6.4.2. Block Diagram

#### 6.4.3. THERMAL HEAD

##### 1. Function

This unit utilizes the state of the art thermal printer technology. The ink film is chemically processed. The ink film is comprised of two parts: an ink layer and a base film. When the thermalhead contacts this ink film, it emits heat momentarily, and the ink layer is melted and transferred to the paper. If this continues, letters and/or diagrams appear, and the original document is reproduced.

## COMPOSITION OF THE RECEIVE RECORD SECTION (THERMAL RECORDING FORMAT)

### 2. Circuit Operation

Refer to the block diagram and the timing chart on the following page.

There are 27 driver ICs aligned horizontally on the thermal head and each one of these ICs can drive 64 heat-emitting registers. This means that one line is at a density of  $64 \times 27 = 1728$  dots = (8 dots/mm).

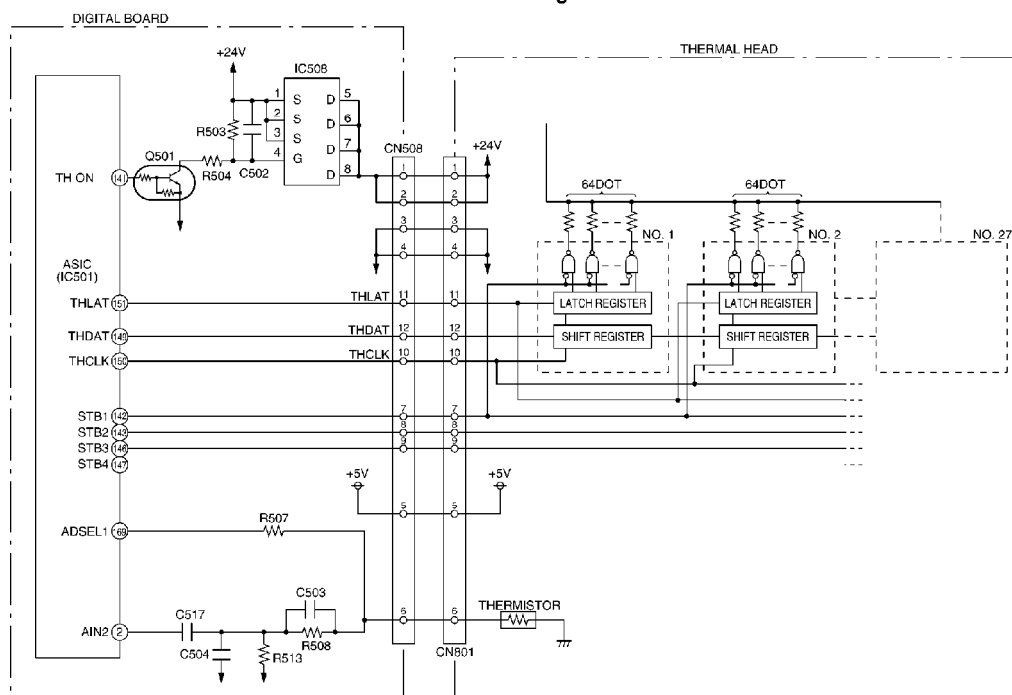

White/Black (white=0, black=1) data in one line increment is synchronized at IC501 pin 150 (THCLK), and sent from IC501 pin 149 (THDAT) to the shift register of the ICs. The shift registers of

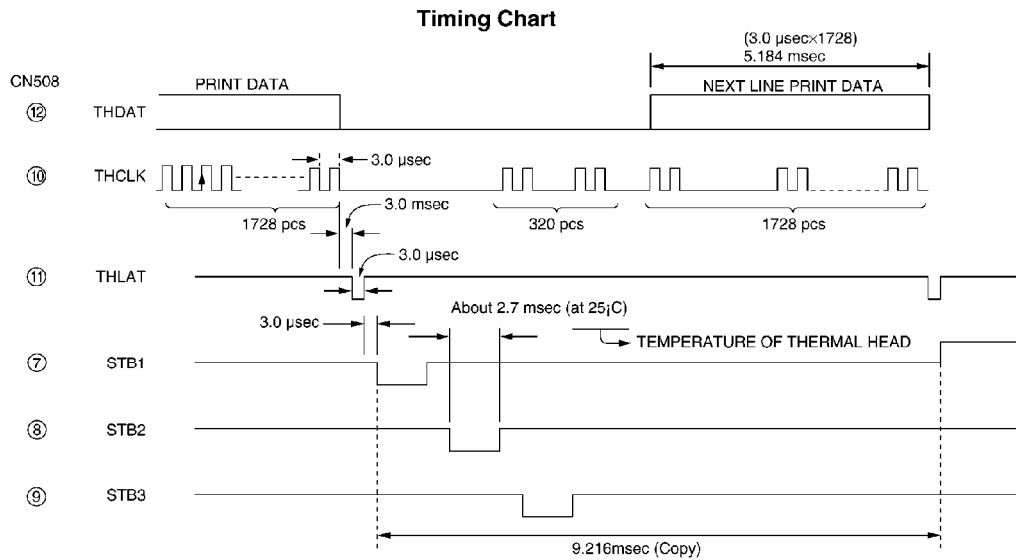

the 27 ICs are connected in series, and upon the shift of the 1728 dot increment, the shift register becomes filled with data, and a latch pulse is emitted to each IC from IC501 pin 151 (THLAT). With this latch pulse, all the contents of the shift registers are latched to the latch registers. Thereafter, through the addition of strobes from the IC501 pins (142, 143, 146), only the dot location of black (=1) among latched data activates the driver, and the current passes to heat the emitting body to cause heat emission. Here, the three line strobes, STB1 to STB3, impress at intervals of 9.216 msec, as required for one-line printout. The sequence is shown on the next page. [Moreover, for the strobe width, the thermistor value inside the thermal head is detected according to IC501 pin 2. Depending on that value, the strobe width is recorded in ROM (IC502). Accordingly, the strobe width is determined.]

When the thermal head is not used, the IC501 (141, THON) becomes low, Q501 turns OFF, IC508 turns OFF, and the +24V power supply for the thermal head driver is not impressed to protect the IC.

Circuit Diagram

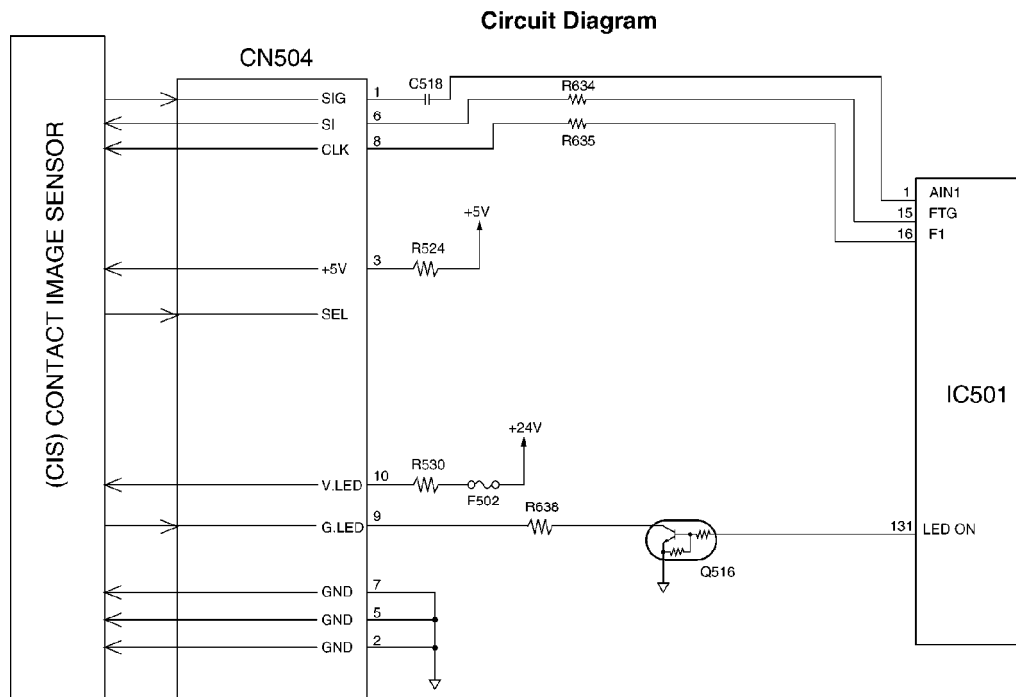

#### 6.4.4. SCANNING BLOCK

The scanning block of this device consists of a control circuit and a contact image sensor made up of a celfoc lens array, an LED array, and photoelectric conversion elements.

When an original document is inserted and the start button pressed, pin 131 of IC501 goes to a high level and the transistor Q516 turns on. This applies voltage to the LED array to light it. The contact image sensor is driven by each of the FTG-F1 signals output from IC501, and the original image illuminated by the LED array undergoes photoelectric conversion to output an analog image signal (SIG). The analog image signal is input to the system ASIC on AIN1 (pin 1 of IC501) and converted into 8-bit data by the A/D converter inside IC501. Then this signal undergoes digital processing in order to obtain a high-quality image.

#### 6.4.5. STEPPING MOTOR DRIVE CIRCUIT

##### 1. Function

The stepping motor works for both transmission and reception.

## 2. Motor

During motor driving, pin 163 of ASIC IC501 becomes a high level, and Q515 turns on. As a result, +24V is supplied to the motor coil. Stepping pulses are output from ASIC IC501 pins, 157, 160~162, causing driver IC506 pins, 15~12 to drive the motor coil. The motor coil is energized sequentially in 2 phase increments, which causes a 1-step rotation. A 1-step rotation feeds 0.13 mm of recording paper or document paper.

The timing chart is below.

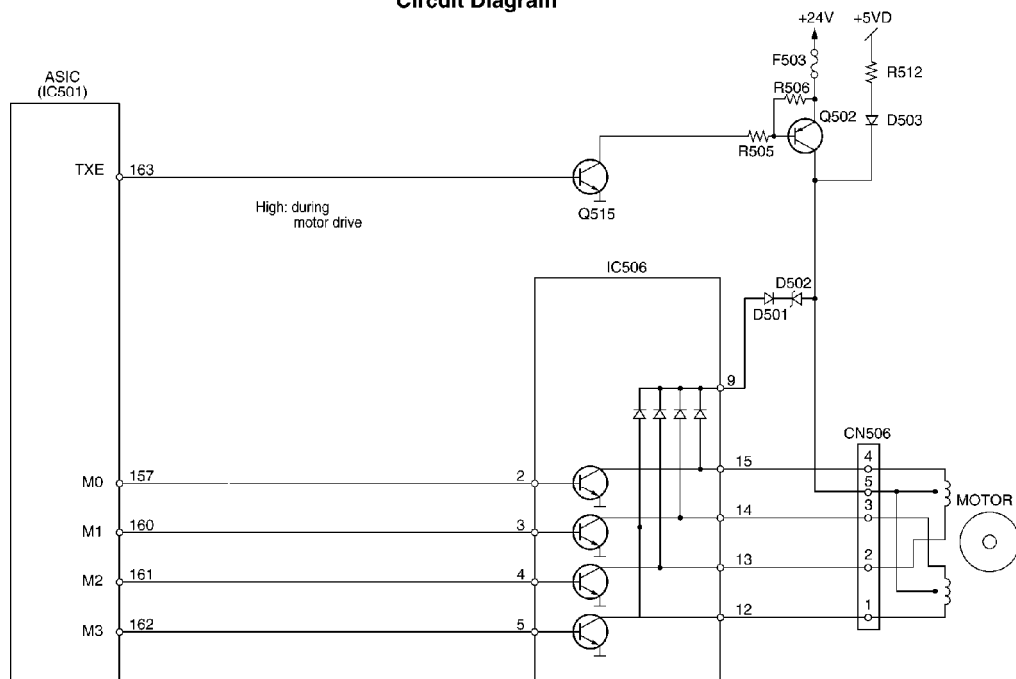

**Stepping Motor Drive Mode**

Function	Mode	Phase Pattern	Speed
Copy	Fine	1-2	216 pps
FAX	Standard	2-2	216 pps
	Fine or Half tone	1-2	216 pps
Paper Feed	—	2-2	216 pps
Stand-by	—	All phases are currently off.	None

**Circuit Diagram**

When the motor suspends while it is in the receive mode (about 70~80 msec), pin 163 of ASIC IC501 becomes a low level and Q515 turns OFF. Then Q502 also turns OFF, and instead of +24 V, +5 V is supplied through D503 so that the motor is held in place. When the system is in the stand-by mode, all of the motor drive transistors turn OFF. Consequently, the motor current stops.

#### 6.4.6. GEAR SECTION

This model provides a motor-driven gear mechanism for transmitting/copying documents and printing fax data. In this chapter, you will see how the gears work to select and operate a mode and how the gear section, sensors and rollers mechanically work during the main operations (FAX transmission, FAX reception and Copy).

##### 6.4.6.1. Mode Selection (See Fig. 1)

When a motor with Drive Motor Gear attached rotates clockwise (CW), Swing Gear C engages G15 and drives G14 to rotate counterclockwise. This operation provide four mode options (A: Transmit mode, B: Paper-Pickup mode, C: Receive mode and D: Copy mode) selected by the Sensor Switch. (The Sensor Switch Lever's position in the CAM (G15) controlled by the software selects a specific mode.) You can see which mode is selected by confirming the Mode Marker's position as shown in / Fig. 1-a~1-d.  
(Ex. If the Mode Marker is in position A, a transmit mode is selected.)

##### Note:

The arrows show the directions in which the active gears turn around.

**Fig. 1: Mode Selection**

#### 6.4.6.2. Mode Operation

Once a mode is selected, the Drive Motor Gear rotates counterclockwise (CCW) and then the controlling positions of Swing Gears A, B and C determine which gears convey their drive power in each mode.

##### A. Transmit mode (See Fig. A.) :

Swing Gear C engages G4 and conveys its power to the Separation Roller Gear through G3 and sets the Separation Roller for feeding documents.

Fig. A: Transmit mode

#### B. Paper-Pickup mode (See Fig. B) :

Swing Gear A engages G10 and provides its power to the Pickup Roller Gear through G8. The Pickup Roller picks up and pre-feeds a recording paper until the recording paper pushes up the PAPER TOP SENSOR\* lever.

**Fig. B: Paper-Pickup mode**

**Note\* :**

See "Sensor Location" in 6.5. SENSORS AND SWITCHES.

**C. Receive mode (See Fig. C.) :**

**Swing Gear B engages G13 and conveys its power to the Platen Roller Gear through G6. Then, the Platen Roller feeds recording paper for printing the received data.**

**Fig. C: Receive mode**

**D. Copy mode (See Fig. D.) :**

**Swing Gears B and C engages G13 and G4 respectively, and then G6 and G3 drive the Pickup Roller Gear and the Separation Roller Gear for feeding recording paper and documents when the unit is in the copy operation.**

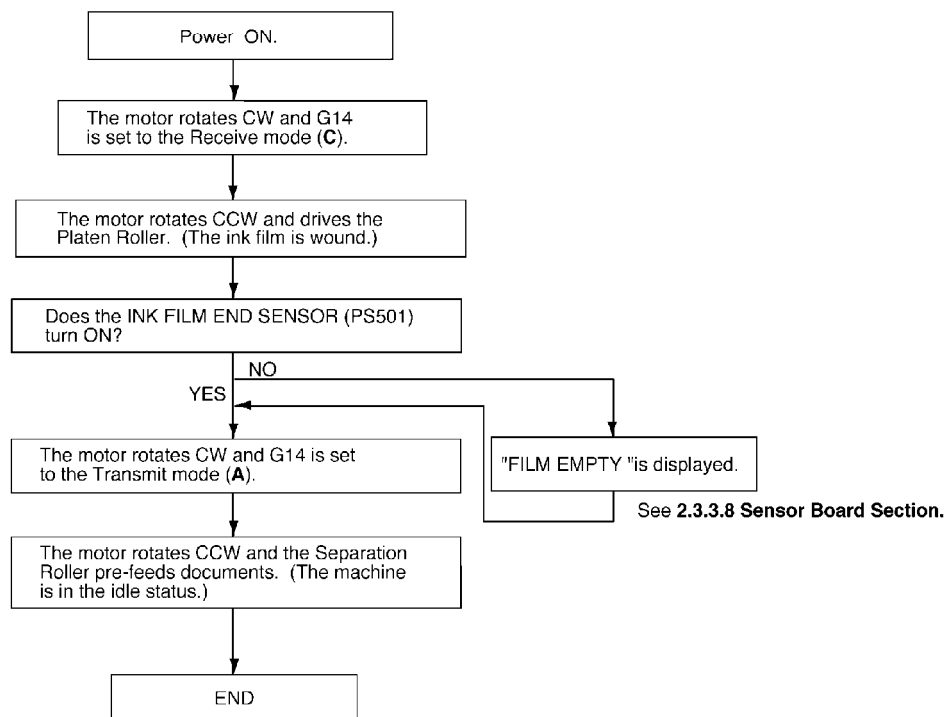

**Fig. D: Copy mode**

### 6.4.6.3. Mechanical movements in the main operations (transmitting documents, receiving faxes and copying)

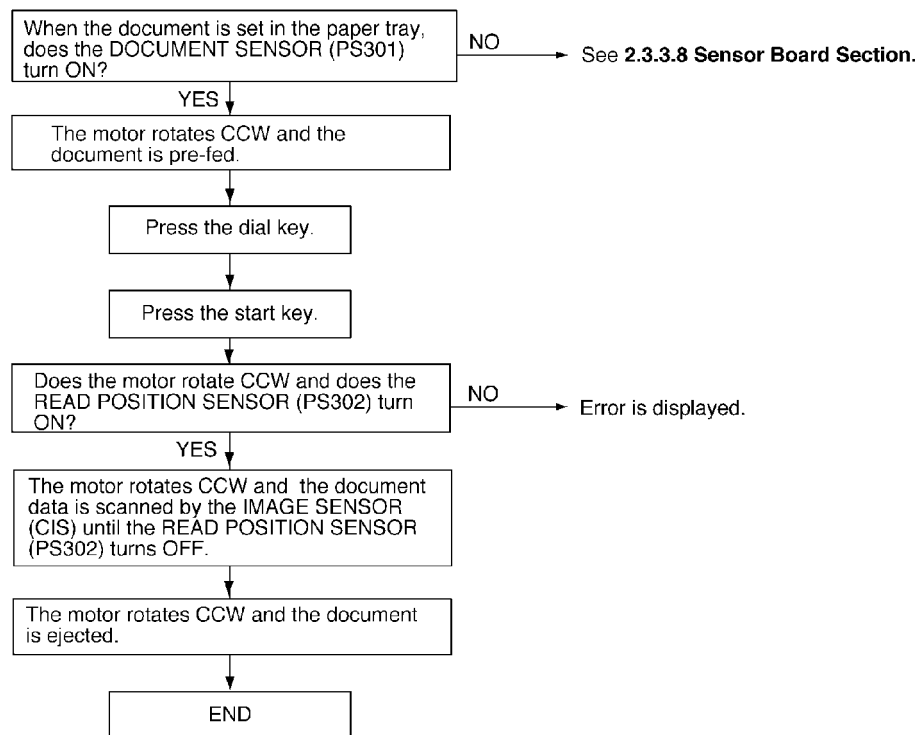

#### 6.4.6.3.1. Idle status

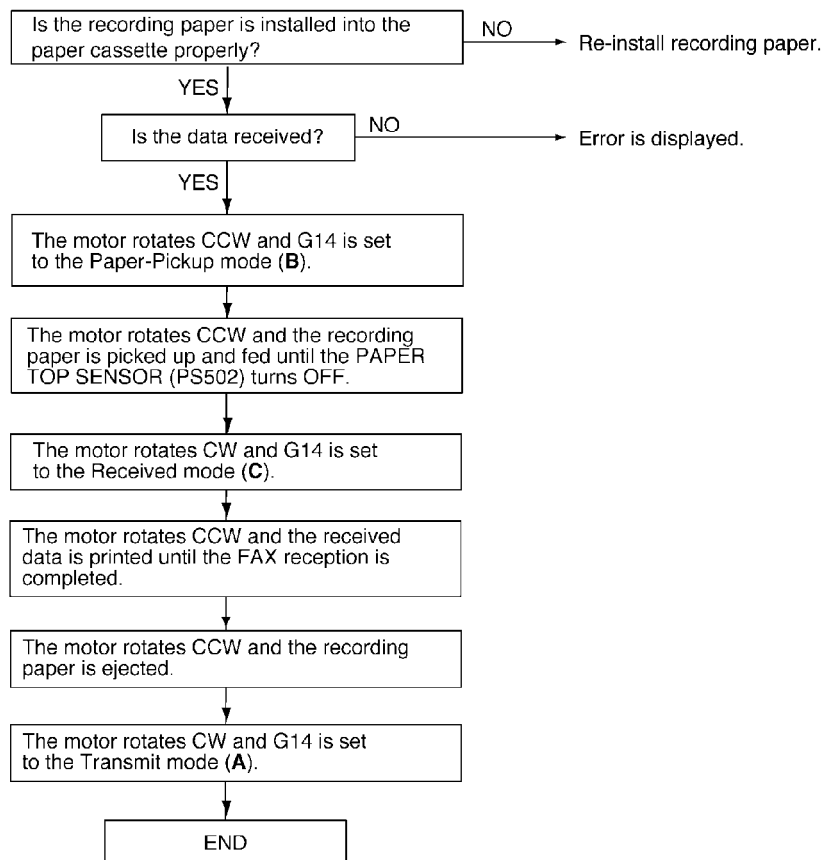

**Note:** See "Sensor Locations" in 6.5. SENSORS AND SWITCHES.

#### 6.4.6.3.2. Transmitting documents

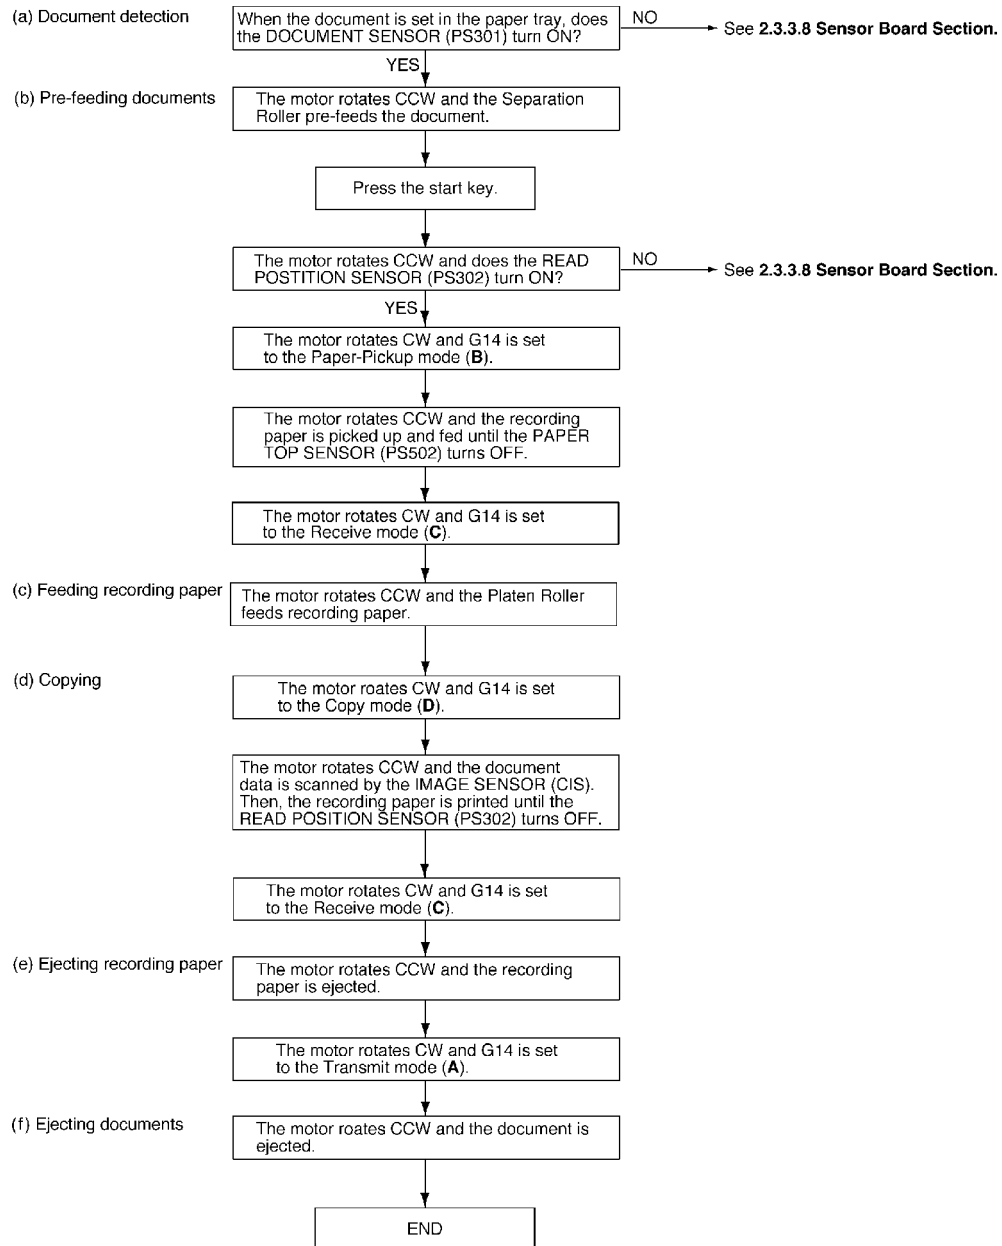

#### 6.4.6.3.3. Receiving FAX

**Note:** See "Sensor Locations" in 6.5. SENSORS AND SWITCHES.

#### 6.4.6.3.4. Copying

**Note:** See "Sensor Locations" in 6.5. SENSORS AND SWITCHES.

## 6.5. SENSORS AND SWITCHES

All of the sensor and switches are shown below.

Sensor Circuit Location	Sensor	Sensor or Switch Name	Message Error
Operation Panel	PS301	Document	[CHECK DOCUMENT]
	PS302	Document Read Position	[REMOVE DOCUMENT]
	PS303	Cover Open	[CHECK COVER]
	SW401	Hook	_____
Digital PCB	PS501	Film End	[FILM EMPTY]
	PS502	Paper Top	[PAPER JAMMED]
Motor Block	SW	Motor Position	_____

**Note:**

See 2.5. TEST FUNCTIONS. (#815: Sensor Check)

#### Sensor Locations

#### 1. [Read Position Sensor (PS302)]

When a document is brought to the read position, the shelter plate is lifted, the phototransistor becomes ON, and the input signal of IC301-20 pin (Operation) becomes a low level. When there is no document at the read position, the shelter plate closes the sensor light, the phototransistor becomes OFF, and the input signal of IC301-20 pin (Operation) becomes a high level. (When checking this sensor, the IC301-9 pin becomes a low level.)

#### Operation Board

	Phototransistor	Signal (IC301-20 pin)
Out of the Read Position	OFF	High level
At the Read Position	ON	Low level

### 2. [Document Sensor (PS301)]

When a document is set, the shelter plate closes the sensor light, the phototransistor becomes OFF, and the input signal of IC301-20 pin (Operation) becomes a high level. When there is no document, the shelter plate is lifted, the phototransistor becomes ON, and the input signal of IC301-20 pin (Operation) becomes a low level. (When checking this sensor, the IC301-4 pin becomes a low level.)

#### Operation Board

	Phototransistor	Signal (IC301-20 pin)
No document	ON	Low level
Set document	OFF	High level

### 3. [Cover Open Sensor (PS303)]

When the operation panel cover is closed, the shelter plate is lifted, the phototransistor becomes ON, and the input signal of IC301-20 pin (Operation) becomes a low level. When the cover is opened, the shelter plate shuts the sensor light, the phototransistor becomes OFF, and the input signal of IC301-20 pin

**(Operation) becomes a high level.**

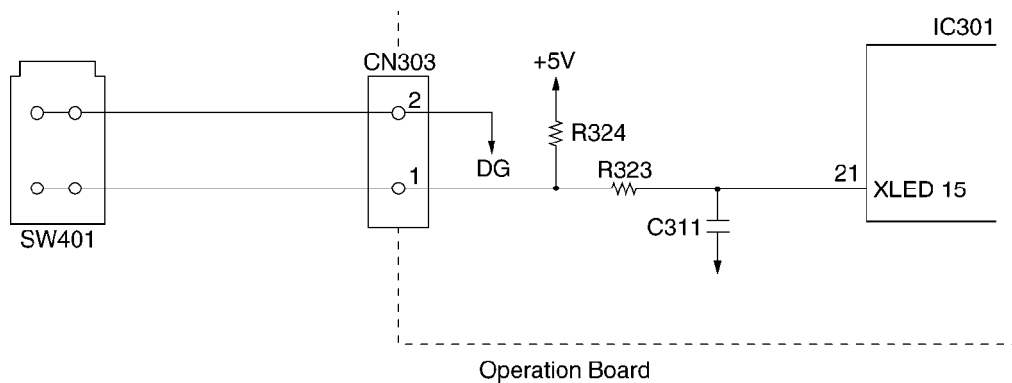

**Operation Board**

	Phototransistor	Signal (IC301-20 pin)
Open	OFF	High level
Closed	ON	Low level

#### 4. [Hook Switch (SW401)]

**When the handset is lifted, the switch turns ON, and the signal at pin 21 of IC301 becomes low.**

**When the handset is returned, the switch turns OFF, and the signal at pin 21 of IC301 becomes high.**

**Operation Board**

	SW	Signal (IC301-21 pin)
ON-Hook	OFF	High level
OFF-Hook	ON	Low level

#### 5. [Paper top Sensor (PS502)]

When the recording paper is loaded on the print head, the shelter plate shuts the sensor light, and the phototransistor becomes OFF. The input signal of IC501-152 pin becomes a high level. Usually, the shelter plate is lifted, the phototransistor becomes ON, and the input signal of IC501-152 pin becomes a low level.

	Phototransistor	Signal (IC501-152 pin)
Set recording paper	OFF	High level
No recording paper	ON	Low level

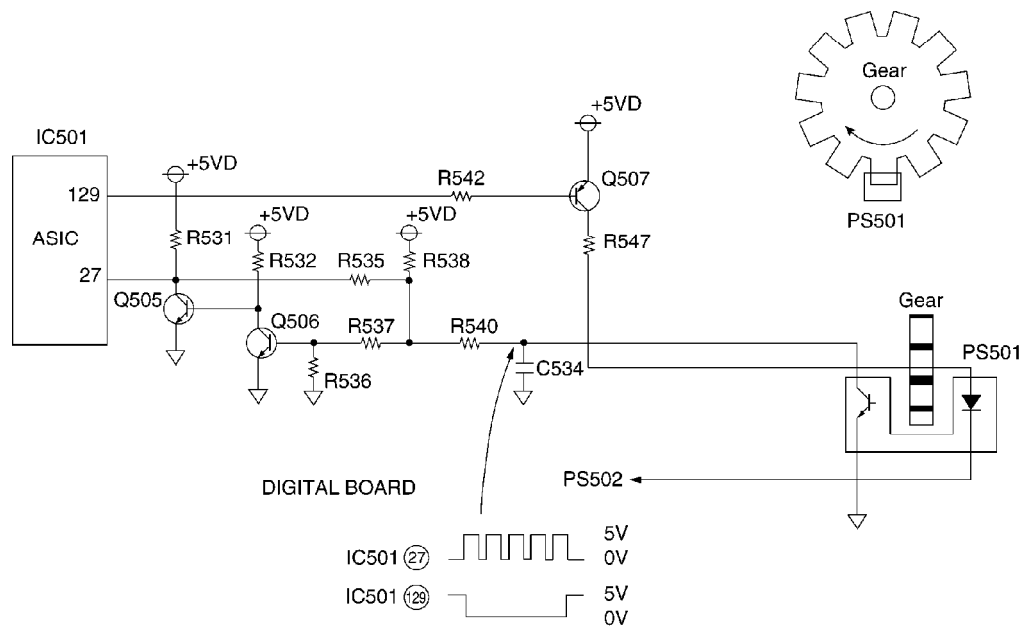

## 6. [Film End Sensor (PS501)]

As the amount of the film decreases, the revolving speed of the rolled film becomes faster. When the film is used up, it comes off from the paper roll. The amount of the remaining film is measured by the revolving speed. When the film stops turning around, the sensor detects the film end.

The rotary encoder rotates slowly when the ink film is full (when printing), as shown in the diagram below. It rotates faster when it is near its end. Sensor PS501 converts the rotation of the rotary encoder into pulses and the amount of the remaining ink film is then calculated internally by the ASIC (IC501) and stored into memory. Then an error message such as "FILM EMPTY" or "FILM NEAR EMPTY" appears on the LCD display.

## 7. [Motor Position Sensor (Switch)]

This sensor is a detection switch for recording the position of the CAM.

Digital Board

	Signal (IC501-153 pin)
Home position	Low level
Other	High level

## 6.6. MODEM SECTION

### 6.6.1. FUNCTION

The unit uses a 1 chip modem (IC505) that serves as an interface between the control section for FAX transmission and reception and the telephone line. During a transmitting operation, the digital image signals are modulated and sent to the telephone line.

During a receiving operation, the analog image signals which are received via the telephone line are demodulated and converted into digital image signals. The communication format and

procedures for FAX communication are standardized by CCITT. This 1 chip modem (IC505) has hardware which sends and detects all of the necessary signals for FAX communication. It can be controlled by writing commands from the CPU (IC501: inside ASIC) to the register in the modem (IC505).

This modem (IC505) also sends DTMF signals, generates a call tone (from the speaker), and detects a busy tone and dial tones.

Overview of Facsimile Communication Procedures (CCITT Recommendation):

## **1. ON CCITT (International Telegraph and Telephone Consultative Committee)**

The No. XIV Group of CCITT, one of the four permanent organizations of the International Telecommunications Union (ITU), investigates and make recommendations on international standards for facsimiles.

## **2. Definition of Each Group**

### **- Group I (G1)**

Official A-4 size documents without using formats which reduce the band width of a signal are sent over telephone lines. Determined in 1968.

Transmission for about 6 minutes at a scanning line density of 3.85 lines/mm.

### **- Group II (G2)**

Using reduction technology in the modulation/demodulation format, an A-4 size document is sent at an official scanning line density of 3.85 lines/mm for about 3 minutes.

Methods to suppress redundancy are not used.

Determined in 1976.

### **- Group III (G3)**

Method of suppressing redundancy in the image signal prior to modulation is used. An A-4 size document is sent within about one minute.

Determined in 1980.

### **- Group IV (G4)**

Transmission is via the data network. A method is provided for suppressing redundancy in signals prior to transmission, and error-free reception of transmission is possible.

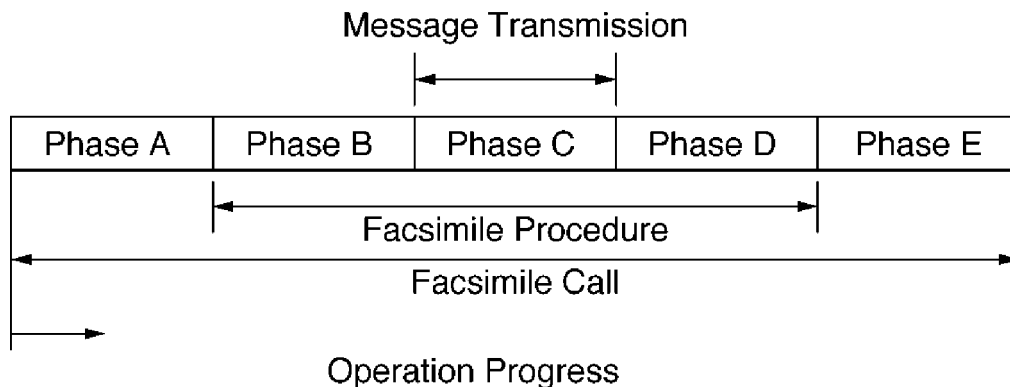

The scope of these facsimile applications is not limited simply to transmission of written statements. Through symbiotic

linkages with other communication methods, it can be expected to expand to include integrated services.

### 3. Facsimile Call Time Series

As shown in the following diagram, the facsimile call time series is divided into five phases.

#### Phase A : Call setting

Call setting can be manual/automatic.

#### Phase B : Pre-message procedure

Phase B is a pre-processing procedure and sequence for confirming the status of the terminal, transmission route, etc., and for terminal control. It implements terminal preparation status, determines and displays terminal constants, confirms synchronization status, etc. and prepares for transmission of facsimile messages.

#### Phase C : Message transmission

Phase C is the procedure for the transmitting facsimile messages.

#### Phase D : Post message procedure

Phase D is the procedure for confirming that the message is completed and received. For continuous transmission, phase B or phase C is repeated for transmission.

#### Phase E : Call retrieval

Phase E is the procedure for call retrieval, that is for circuit disconnection.

### 4. Concerning Transmission Time

$$[\text{Transmission Time}] = [\text{Control Time}] + [\text{Image Transmission Time}] + [\text{Hold Time}]$$

## Transmission time consists of the following.

### Control time:

This is time at the start of transmission when the functions at the sending and receiving sides are confirmed, the transmission mode is established, and transmission and reception are synchronized.

### Image transmission time:

This is the time required for the transmission of document contents (image data). In general, this time is recorded in the catalog, etc.

### Hold time:

This is the time required after the document contents have been sent to confirm that the document was actually sent, and to check for telephone reservations and/or the existence of continuous transmission.

## 5. Facsimile Standards

Item	Telephone Network Facsimile
	G3 Machine
Connection Control Mode	Telephone Network Signal Mode
Terminal Control Mode	T. 30 Binary
Facsimile Signal Format	Digital
Modulation Mode	PSK (V. 27 ter) or QAM (V. 29)
Transmission Speed	300 bps (Control Signal) 2400, 4800, 7200, 9600, 12000, 14400 bps (FAX Signal)
Redundancy Compression	1 dimension : MH Mode 2 dimension : MR Mode (K=2.4)
Process (Coding Mode)	
Resolution	Main Scan : 8 pel/mm Sub Scan : 3.85, 7.7l/mm
Line Synchronization Signal	EOL Signal
1 Line Transmission Time [ms/line]	Depends on the degree of data reduction. Minimum Value : 10, 20 Can be recognized in 40ms.

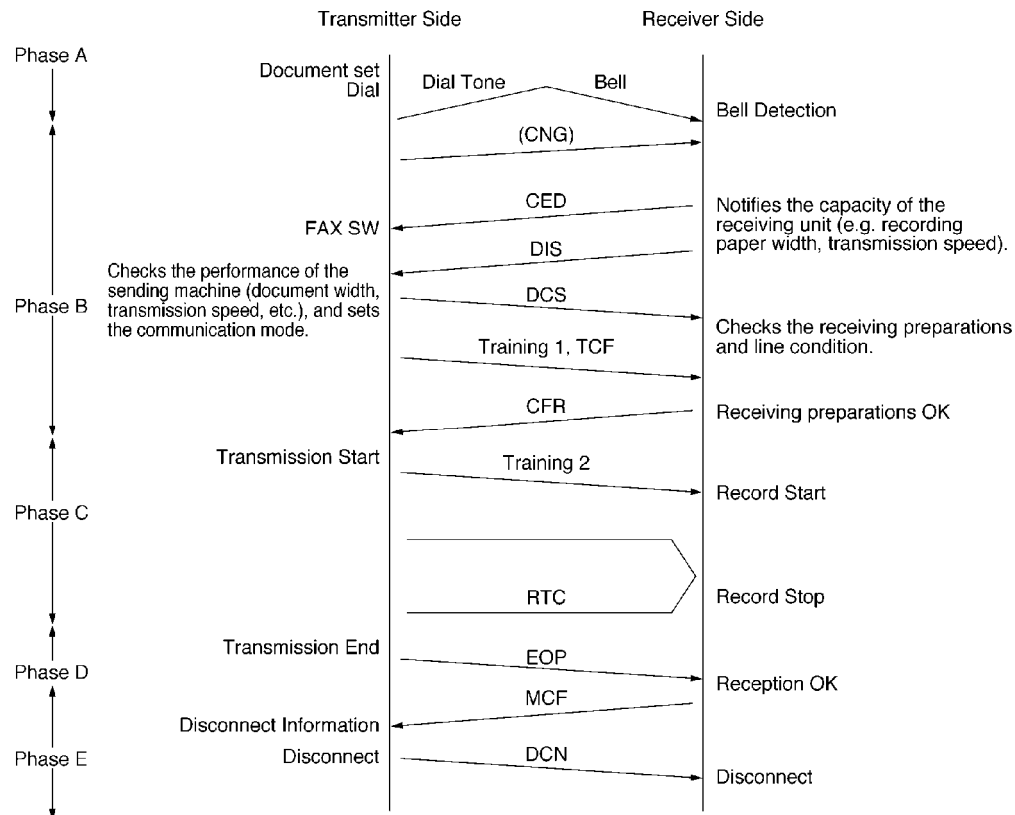

## 6. Explanation of Communication and Compression Technology

### A. G3 Communication Signals (T. 30 Binary Process)

For G3 Facsimile communication, this is the procedure for exchanging control signals between the sending and receiving

machines both before and after transmission of image signals.  
**Control signals at 300 bps FSK are: 1850 Hz...0, 1650Hz...1.** / An example of a binary process in G3 communication is shown below.

### Explanation of Signals

**Control signals are comprised mainly of 8-bit identification signals and the data signals added to them. Data signals are added to DIS and DCS signals.**

**Signal.....DIS (Digital Identification Signal) / Identification Signal Format.....00000001**

**Function: / Notifies the capacity of the receiving unit. The added data signals are as follows.**

**Signal.....DCS (Digital Command Signal) / Identification Signal Format.....X1000001**

**Example (Some models do not support the following items.):**

Bit No.	DIS/DTC	DCS
1	Transmitter --- T.2 operation	
2	Receiver --- T.2 operation	Receiver --- T.2 operation
3	T.2 IOC = 176	T.2 IOC = 176
4	Transmitter --- T.3 operation	
5	Receiver --- T.3 operation	Receiver --- T.3 operation
6	Reserved for future T.3 operation features	
7	Reserved for future T.3 operation features.	
8	Reserved for future T.3 operation features.	
9	Transmitter --- T.4 operation

Signal	Identification Signal Format	Function
Training 1	_____	A fixed pattern is transmitted to the receiving at a speed (2400 to 9600 bps) designated by L and the receiving side optimizes the automatic equalizer, etc., according to this signal.
TCF (Training Check)	_____	Sends 0 continuously for 1.5 seconds at the same speed as the training signal.
CFR (Confirmation to Receive)	X0100001	Notifies the sending side that TCF has been properly received. If TCF is not properly received, FTT (Failure To Train) X0100010 is relayed to sender. The sender then reduces the transmission speed by one stage and initiates training once again.
Training 2	_____	Used for reconfirming the receiving side like training 1.
Image Signal	Refer to the next page.	_____
RTC (Return to Control)	_____	Sends 12 bits (0...01 × 6 times) to the receiver at the same speed as the image signal and notifies completion of transmission of the first sheet.
EOP (End of Procedure)	X1110100	End of one communication
MCF (Message Confirmation)	X0110001	End of 1 page reception
DCN (Disconnect)	X1011111	Phase E starts.
MPS (Multi-Page Signal)	X1110010	Completion of transmission of 1 page. If there are still more documents to be sent, they are output instead of EOP. After MCF reception, the sender transmits an image signal of the second sheet.
PRI-EOP (Procedural Interrupt-EOP)	X1111100	If there is an operator call from the sender, it is output after RTC.
PIP (Procedural Interrupt Positive)	X0110101	This is output when an operator call is received.

## B. Redundancy Compression Process Coding Mode / This unit uses one-dimensional MH format.

## 6.6.2. MODEM CIRCUIT OPERATION

The modem (IC505) has all the hardware satisfying the CCITT standards mentioned previously. When the ASIC IC501 (77) is brought to a low level, the modem (IC505) is chip-selected and the resistors inside IC are selected by the select signals from ASIC (IC501) ADR0-ADR4(pin 107~111). Commands are written through the data bus, and all processing is controlled by the ASIC (IC501)

according to CCITT procedures. Here, the **INT** signal dispatched from **IRQ** (pin 52 of IC505) to the ASIC (IC501) implements post processing.

This modem (IC505) has an automatic application equalizer. With training signal 1 or 2 at the time of G3 reception, it can automatically establish the optimum equalizer. The modem (IC505) clock is supplied by pin 70 of ASIC (IC501).

### 1. Facsimile Transmission/DTMF Line Send

The digital image data on the data bus is modulated in the modem (IC505), and sent from pin 44 via amplifier IC511 (24 → 25), and the NCU section to the telephone line.

Refer to 2.3.3.5. Analog Board Section.

### 2. Facsimile Reception

The analog image data which is received from the telephone line passes through the NCU section and enters pin 45 of the modem (IC505). The signals that enter pin 45 of the modem (IC505) are demodulated in the board to digital image signals, then placed on the data bus.

In this case, the image signals from the telephone line are transmitted serially. Hence, they are placed on the bus in 8 bit

units. Here, the internal equalizer circuit reduces the image signals to a long-distance receiving level.

This is designed to correct the characteristics of the frequency band centered around 3 kHz and maintain a constant receiving sensitivity.

It can be set in the service mode.

Refer to 2.3.3.5. Analog Board Section.

### **3. DTMF Transmission (Monitor tone)**

The DTMF signal generated in the modem (IC505) is output from pin 44, and the NCU section to the telephone line the same as facsimile transmission signals.

(DTMF Monitor Tone)

Refer to 2.3.3.5. Analog Board Section.

### **4. Busy/Dial Tone Detection**

The path is the same as FAX receiving. When it is detected, the carrier detect bit of the resistor in the modem (IC505) becomes 1, and this status is monitored by ASIC (IC501).

## **6.7. DESCRIPTION OF BLOCK DIAGRAM IN ANALOG SECTION**

### **1. Function**

The analog section is composed of the following circuits.

A. Interface circuit to connect with telephone line (NCU)

B. Analog gate array (IC511)

- To change the circuit configuration for Tx/Rx signals of handset, and fax signals.

Following is the detailed description of each circuit.

[NCU]:Network Control Unit

The NCU comprises of the following; DC loop forming circuit to connect with the telephone line; Switching circuit for other interconnected telephones; Bell detection circuit; Pulse dial generation circuit; Extension phone line off-hook detection circuit; Sidetone circuit; Remote fax activation circuit. Refer to 6.8. NCU SECTION for the details.

[Analog gate array (IC511)]

The cross-point switch installed in this IC makes it possible to change the circuit configuration for any analog signals such as the fax signals sent from the digital MODEM board. In addition, this analog gate array integrates a handset circuit, input/output ports, etc. This IC is controlled by ASIC (IC501) on the digital board.

### 6.7.1. ANALOG UNIT BLOCK DIAGRAM

## 6.8. NCU SECTION

### 6.8.1. GENERAL

This section is the interface between the telephone line and external telephone. It is composed of an EXT. TEL line relay (RL101), bell detection circuit, pulse dial circuit, TAM interface circuit, line amplifier and sidetone circuits and a multiplexer.

### 6.8.2. EXT. TEL. LINE RELAY (RL101)

#### 1. Circuit Operation

Normally, this relay switches to the external telephone side (break) and switches to the open side (make) while OFF-HOOK.

{ IC501 (58) High Level → CN501 (6) High Level } → CN101 (6) High Level → Q108 ON → RL101 (make)

### 6.8.3. BELL DETECTION CIRCUIT

#### 1. Circuit Operation

The signal waveform for each point is indicated below. The signal (low level section) input to pin 63 of ASIC IC501 on the digital board is read by ASIC and judged as a bell.

TEL LINE → PC103 (1, 2 - 4) → IC501 (63)

Between the Tip and Ring  
from the telephone line

Between PC103 (1) and (2)

PC103 (4)/ASIC IC501 (63)

### 6.8.4. TAM INTERFACE CIRCUIT

This circuit is to switch between FAX receiving and the external TAM's message recording automatically. This circuit consists of an EXT. TAM OFF-HOOK detect circuit, monitor transformer, multiplexer, amplifier, and VOX detect circuit.

For details, please refer to 6.10. TAM INTERFACE SECTION.

### 6.8.5. LINE AMPLIFIER AND SIDE TONE CIRCUIT

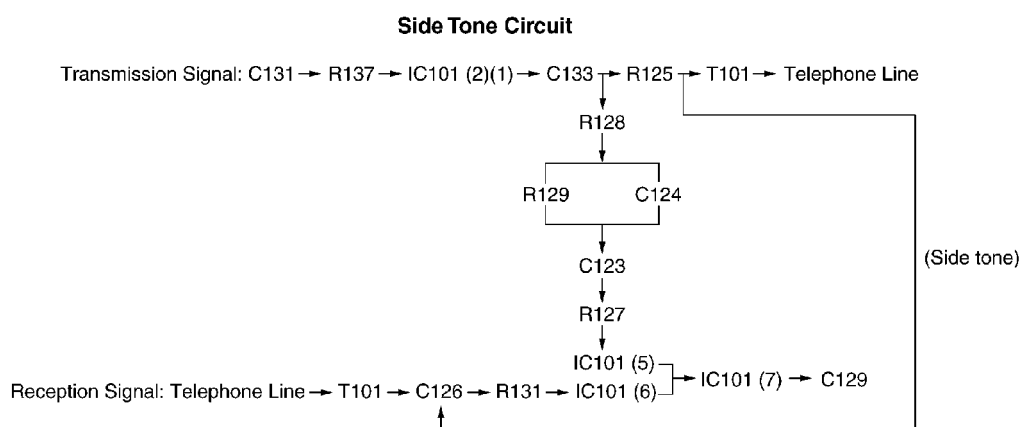

#### 1. Circuit Operation

The reception signal output from the line transformer T101 is input

to pin (6) of IC101 via C126 and R131, and then the signal is amplified at pin (7) of IC101 and sent to the reception system at 11.6dB.

The transmission signal goes through C131 and R137 and enters IC101-pin (2), where the signal is amplified to about 7.4dB. Then, it is output from pin (1) of IC101 and transmitted to T101 via C133 and R125. If the side tone circuit is not applied, the transmission signal will return to the reception amplifier via C126 and R131. When the side tone circuit is active, the signal output from IC101 pin (1) passes through C133, R128, R129, C124, C123 and R127 and goes into the amplifier IC101 pin (5). This circuit is used to cancel the transmission return signal.

## 6.8.6. CALLING LINE IDENTIFICATION CIRCUIT

### 1. Function

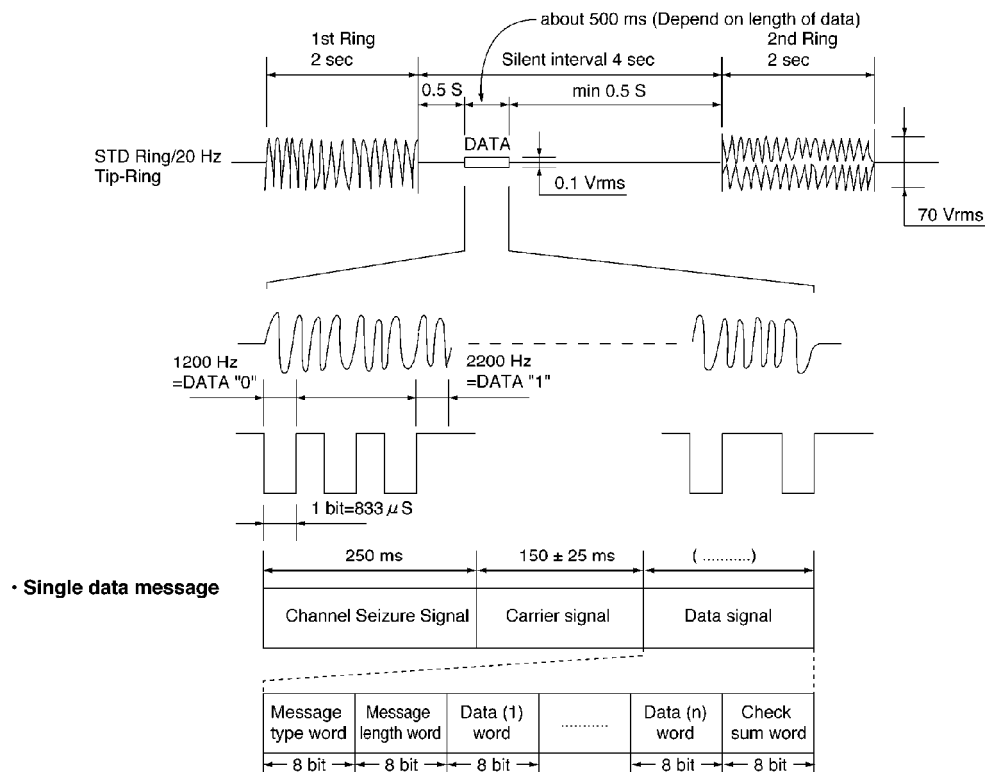

This unit is compatible with the Caller ID service offered by your local telephone company. To use this feature, you must subscribe to a Caller ID service. The data for the caller ID from the telephone exchange is sent during the interval between the first and second rings of the bell signal. The data from the telephone exchange is a modem signal which is modulated in an FSK (Frequency Shift Keying) format. Data "0" is a 1200 Hz sine wave, and data 1 a 2200 Hz sine wave. / There are two type of the message format which can be received:i.e.the single data message format and multiple data message format. / The multiple data format allows to transmit the name and data code information in addition to the time and telephone number data. / When there is multiple data in the unit, the name or telephone number are displayed.

## 2. Circuit Operation:

The caller ID signal input from TEL LINE is processed with MODEM (IC505). / Refer to 2.3.3.5. Analog Board Section for the route of caller ID signal.

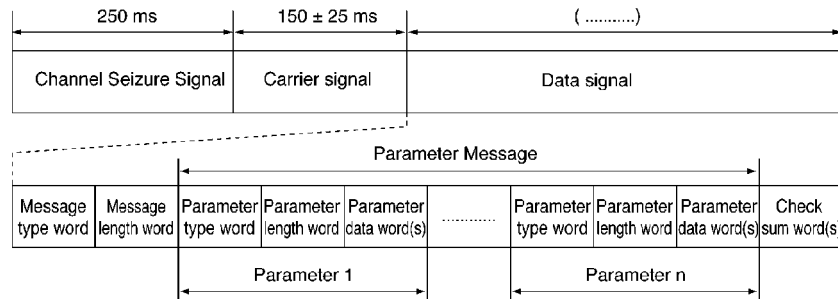

Timing Chart

- 1 word = All 8 bit data
- Message Type Word = Fixed value "00000100"
- Message Length Word = number of the data word
- Data word = The data value (month, day, hour, minute, telephone number)

- Multiple data message

- 1 word = All 8 bit data
- Message Type = Fixed value "10000000"
- Message Length Word = number of the Parameter Message word
- Parameter Type Word = Kind of data (ex. the time, phone number)
- Parameter Length Word = number of the Parameter data word
- Parameter Word (s) = the data value

## 6.9. ITS (Integrated telephone System) and MONITOR SECTION

### 6.9.1. GENERAL

The general ITS operation is performed by the special IC511 which has a handset circuit. The alarm tone, the key tone, and the beep are output from the ASIC IC501 (digital board). During the pulse dial operation, the monitor tone is output from the ASIC IC501.

### 6.9.2. TELEPHONE MONITOR

#### 1. Function

This is the function when you are not holding the handset and can hear the caller's voice from the line.

#### 2. Signal path

Refer to 2.3.3.5. Analog Board Section.

### 6.9.3. HANDSET CIRCUIT

#### 1. Function

This circuit controls the conversation over the handset, i.e. the transmitted and received voices to and from the handset.

#### 2. Signal path (Transmission signal)

Refer to 2.3.3.5. Analog Board Section.

#### 3. Signal path (Reception signal)

Refer to 2.3.3.5. Analog Board Section.

### 6.9.4. MONITOR CIRCUIT

#### 1. Function

This circuit monitors various tones, such as ① DTMF tone, ② Alarm/Beep/Key tone/Bell ③ Dummy ring back tone.

## 2. Signal path

### A. DTMF MONITOR

(Speaker Operation)

Refer to 2.3.3.5. Analog Board Section.

(Handset Operation)

Refer to 2.3.3.5. Analog Board Section.

### B. ALARM/BEEP/KEY TONE/BELL

Refer to 2.3.3.5. Analog Board Section.

### C. DUMMY RING BACK TONE

Refer to 2.3.3.5. Analog Board Section.

## 6.10. TAM INTERFACE SECTION

### 6.10.1. FUNCTION

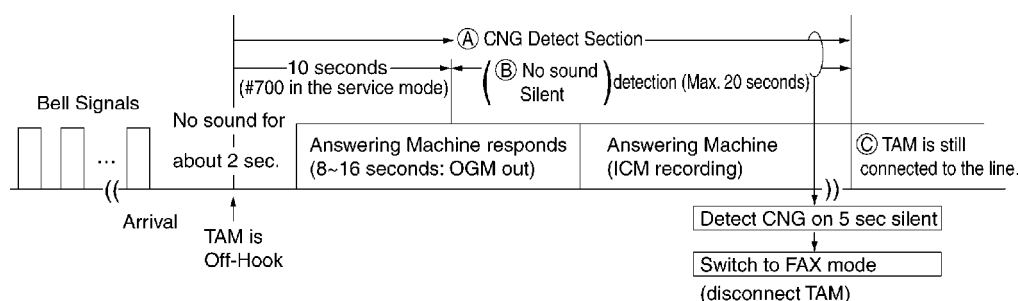

If EXT. TAM is selected in the Receive mode, the unit receives documents for FAX calls or the external TAM records a voice message automatically.

To switch between the answering machine and facsimile in the EXT. TAM Mode.

#	EXTERNAL TAM OPERATION	UNIT OPERATION
1	When the bell signal rings as many times as the number memorized into the connected answering machine (TAM), the answering machine is connected to the line and the answering message is sent out to the line. (OGM out for 8 ~ 16 sec.)	<p>The length of the answering message should be 8~16 seconds.</p> <p>While the message is being played, the unit starts to detect the CNG signal. (A)</p> <p>If the unit detects the CNG signal, it will switch to FAX receiving and disconnect the external TAM automatically.</p>

#	EXTERNAL TAM OPERATION	UNIT OPERATION
2	After sending the OGM, the answering machine starts to record the message of the other party (ICM recording).	<p>After the OGM of the external TAM is finished, the unit starts to detect approximately 5 seconds of no sound</p> <p>(B) detection. (B)</p> <p>If no sound is detected, the unit will switch to FAX receiving and disconnect the external TAM automatically.</p> <p>If the unit cannot detect the CNG signal or no sound for about 30 seconds, the unit will</p> <p>(C) disconnect the line. (C)</p>

#### Attention 1:

No sound detection lasts 20 seconds after the telephone call is received at the answering machine. If there is no sound for more than 5 seconds (#701 in the service mode), it switches to the facsimile.

#### Attention 2:

When the answering machine cannot answer the telephone call because of disconnection or the recording tape is full, the unit picks up the call after 5 rings (#702 in the service mode). Then it switches to the facsimile.

### 6.10.2. CIRCUIT OPERATION

The TAM INTERFACE circuit consists of an EXT. TAM HOOK detection circuit, CNG signal from the other party's detection circuit, VOX detection circuit (to judge sound/no-sound) and RL101 (to separate EXT. TAM).

#### 1. EXT. TAM HOOK detection circuit

A bell is received at EXT. TAM and EXT. TAM is connected to the line, making a DC LOOP. Then, PC105 detects this voltage. During detection, PC105 (4) becomes low.

(DC LOOP)

Tip → L101 → LF101(4, 1) → L104 → Tip1 → (EXT.TAM) → Ring 1

→ L105 → R113 → RL101(5, 3) → PC105(1, 2) → LF101(2, 3) →  
L102 → POS101 → Ring

## 2. CNG signal detection circuit

The CNG signal from the other party's FAX is detected in MODEM IC505 (digital board).

(Signal path)

Refer to 2.3.3.5. Analog Board Section.

## 3. VOX

The VOX circuit detects if there is a signal or voice on the line.

This is why the VOX circuit reacts to the OGM of the EXT.TAM and ICM from the other party.

(Signal path)

Telephone Line → C112 → T102 → CN101(9) → {CN501(9) → C596 → R595 → IC511(20, 21) → C610 →  
EXT.TEL Line → R113 →

R613 → Q513(B, C) → C581 → R582 → IC511(7, 5) → IC501(36)}

## 4. Remote receiving

This is the parallel-connected DTMF signal for the TEL or EXT.TEL mode between T and R. When the other party is a FAX, the unit switches to FAX receiving.

(Signal Path)

Detects the DTMF signal in the MODEM.

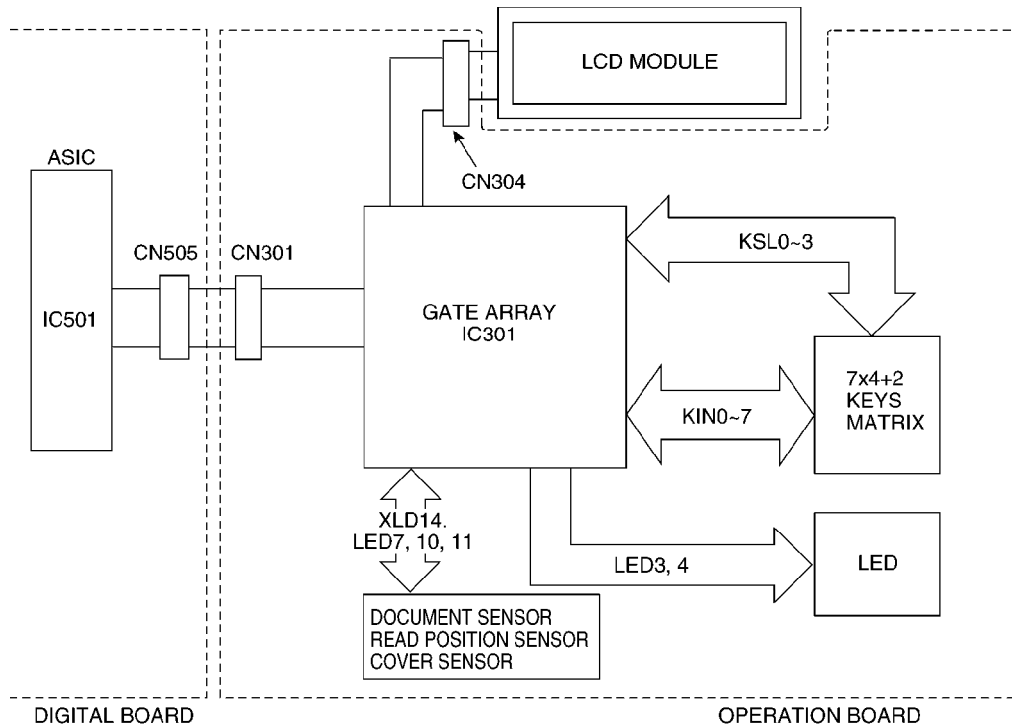

{ } : Inside the digital board

## 6.11. OPERATION BOARD SECTION

The unit consists of a LCD (Liquid crystal display), KEYS and LEDs (light-emitting diodes). They are controlled by the Gate Array (IC301) and ASIC (IC501: on the DIGITAL BOARD). (Fig.-a) / The key matrix table is shown below.

Fig-a

## 6.12. LCD SECTION

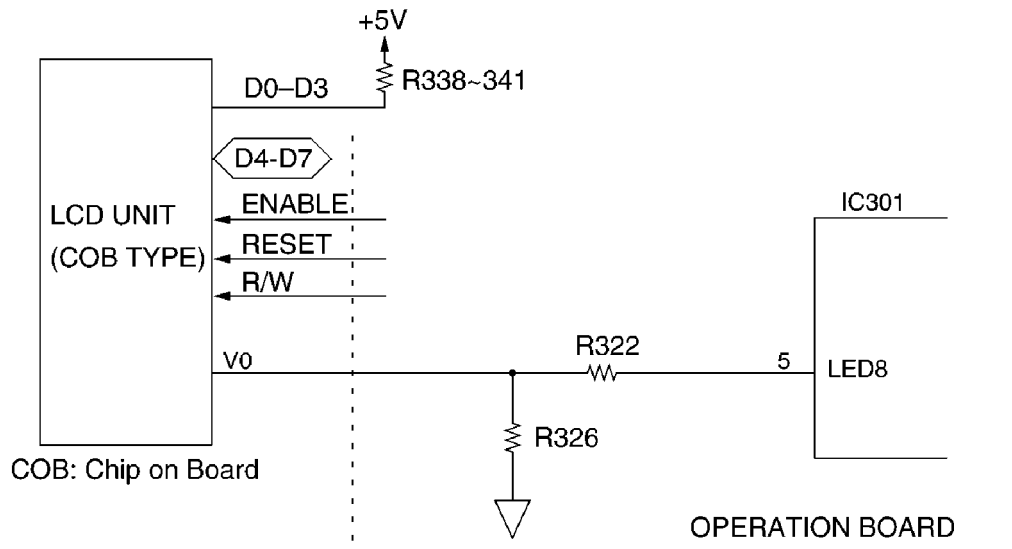

The Gate Array (IC301) works only for writing the ASCII code from the data bus (D4~D7). V0 is supplied for the crystal drive.

R326 and R322 are density control resistors.

Consequently, in this unit, the timing (positive clock) is generated by the LCD interface circuitry in the gate array (IC301).

### Circuit Diagram

### Timing Chart

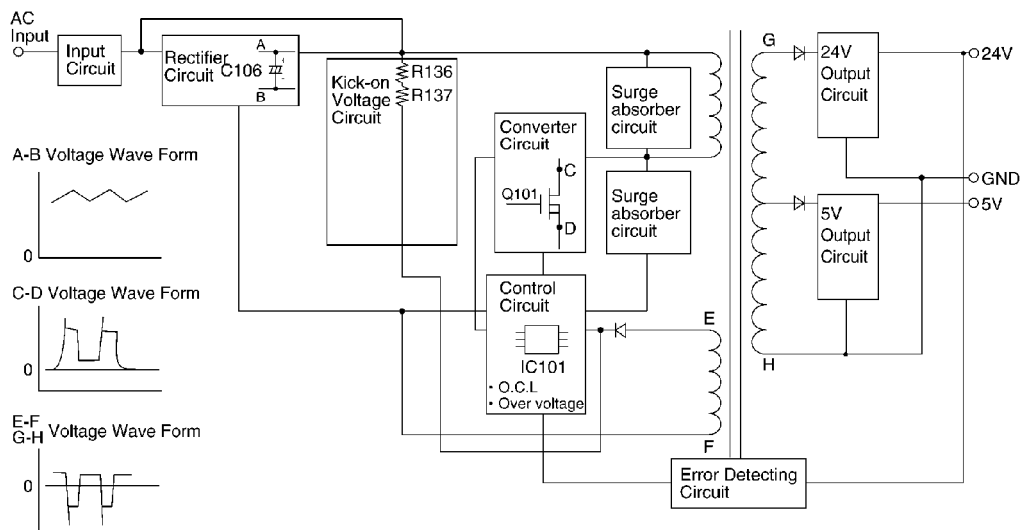

Density	Normal	Dark
LED8 (IC301-5pin)	H	L

## 6.13. POWER SUPPLY BOARD SECTION

This power supply board uses the switching regulator method.

### Block Diagram

#### [Input Circuit]

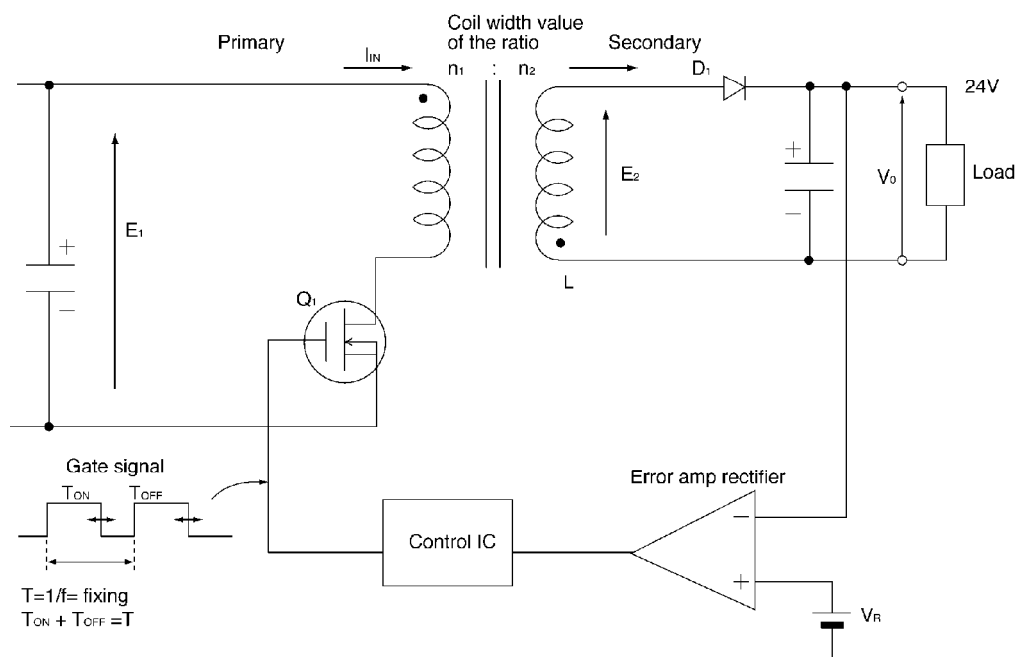

The input current goes into the input rectifier circuit through the filter circuit. The filter circuit decreases the noise voltage and the noise electric field strength.

#### [Rectifier Circuit]

The input current is rectified by D101,D102,D103 and D104 and charges C106 to make DC voltage. Then it supplies power to the converter circuit.

#### [Kick-on voltage circuit]

Bias is applied to the Q101 gate via this circuit when the AC power is turned on and Q101 begins operating.

The following is an overview of how the power supply unit is controlled.

The control method of this power supply unit is pulse width modulation.

When Q<sub>1</sub> is ON, the energy is charged in the transfer primary coil according to E<sub>1</sub>. When Q<sub>1</sub> is OFF, the energy is output from the secondary transfer as follows.

$L \rightarrow D_1 \rightarrow \text{Load} \rightarrow L$

Then the power is supplied to the Load. When Q<sub>1</sub> is ON, power is not output from the secondary side. The output voltage is fed back in the control IC according to the error amp rectifier. Then depending on how T<sub>ON</sub> is controlled, stabilization occurs. Also, when the current load becomes

too large, in order to decrease the voltage output, the increase in  $\tau$  is controlled and the output voltage is stabilized.

Therefore, basically the timing: T<sub>on</sub>/T<sub>off</sub> of Q<sub>1</sub> controls the output voltage.

## Output/Input voltage value of ratio

### [Surge Absorber Circuit]

This circuit is for absorbing surge voltage generated by the transformer.

### [Control Circuit and Detecting Circuit]

The control circuit amplifies the output with increased voltage detected in the error detecting circuit. Then it drives the main transistor.

In this power supply, the duty ratio is defined by changing the ON period of the main transistor. This is shown as follows.

When the output voltage of the 24V circuit increases, the current of the photo coupler PC101 increases, the pulse width of the output control IC becomes narrower and the ON period of Q101 becomes shorter.

### [Over Current Limiter (O.C.L.)]

The highest drain current (Q101) is limited by a limiter circuit (IC101) of 24V. The 24V output is limited by this circuit.

#### [Over Voltage Circuit]

If the 24V output increases because the error detecting circuit or control circuit is broken, IC101 will recognize this signal and output becomes 0V.

Dummy load method (to quickly check the power supply output)

Refer to 2.3.3.6. Power Supply Board Section.

## 7. FOR THE SCHEMATIC DIAGRAMS

Note:

1. DC voltage measurements are taken with an oscilloscope or a tester with a ground.
2. The schematic diagrams and circuit board may be modified at any time with the development of new technology.

## 20. ACCESSORIES AND PACKING MATERIALS

## 21. REPLACEMENT PARTS LIST

This replacement parts list is for KX-FP105 only.

Refer to the simplified manual (cover) for other areas.

Notes:

1. The marking (RTL) indicates that the Retention Time is limited for this item.  
After the discontinuation of this assembly in production, the item will continue to be available for a specific period of time. The retention period of availability is dependent on the type of assembly, and in accordance with the laws governing parts and product retention.  
After the end of this period, the assembly will no longer be available.
2. Important safety notice / Components identified by  mark have special characteristics important for safety. When replacing any of these components, use only manufacture's specified parts.
3. The S mark indicates service standard parts and may differ from production parts.
4. RESISTORS & CAPACITORS / Unless otherwise specified; / All resistors are in ohms (  $\Omega$  ) K=1000  $\Omega$  , M=1000k  $\Omega$  / All capacitors are in MICRO FARADS (  $\mu$  F ) P=  $\mu$   $\mu$  F / \*Type & Wattage of Resistor

## 21.7. FIXTURES AND TOOLS

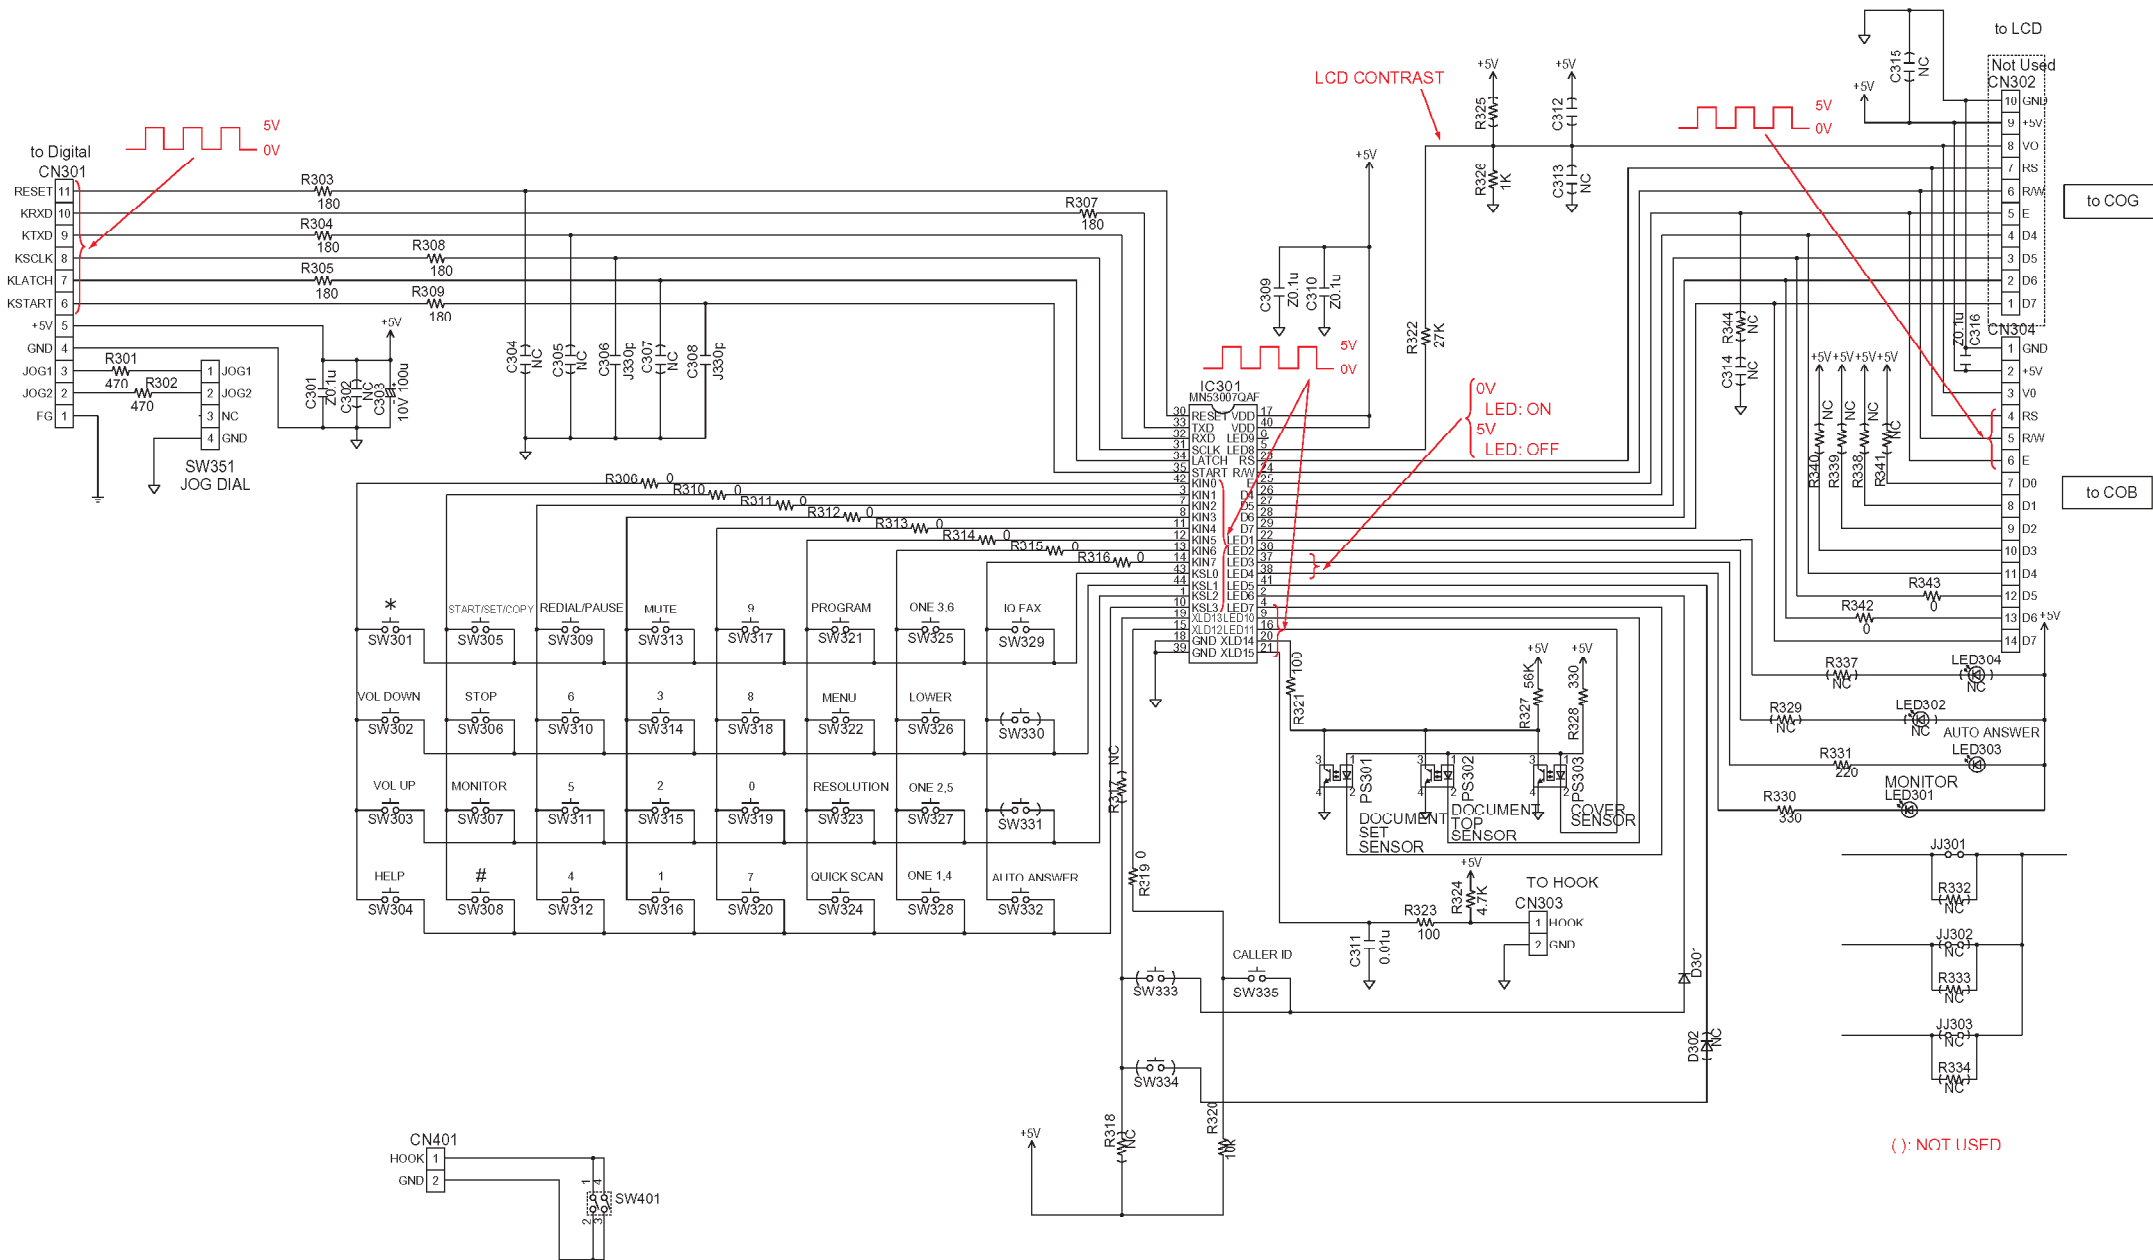

Ref. No.	Part No.	Part Name & Description	Remarks
<b>EC1</b>	PQZZ2K6Z	CONNECTOR, 2P	
<b>EC2</b>	PFZZ5K13Z	CONNECTOR, 5P	
<b>EC3</b>	PQZZ12K4Z	CONNECTOR, 12P	
<b>EC4</b>	PQZZ2K12Z	CONNECTOR, 2P	
<b>EC5</b>	PFZZ11K12Z	CONNECTOR, 11P	
<b>EC6</b>	PQZZ10K4Z	CONNECTOR, 10P	
<b>EC7</b>	PQZZ8K18Z	CONNECTOR, 8P	
<b>EC8</b>	PFZZ9K1Z	CONNECTOR, 9P	
<b>EC9</b>	PFZZ10K1Z	CONNECTOR, 10P	
<b>EC10</b>	PQZZ2K1Z	CONNECTOR, 2P	
	KM79811245C0	BASIC FACSIMILE TECHNIQUE	
		(for training service technicians)	

### Note:

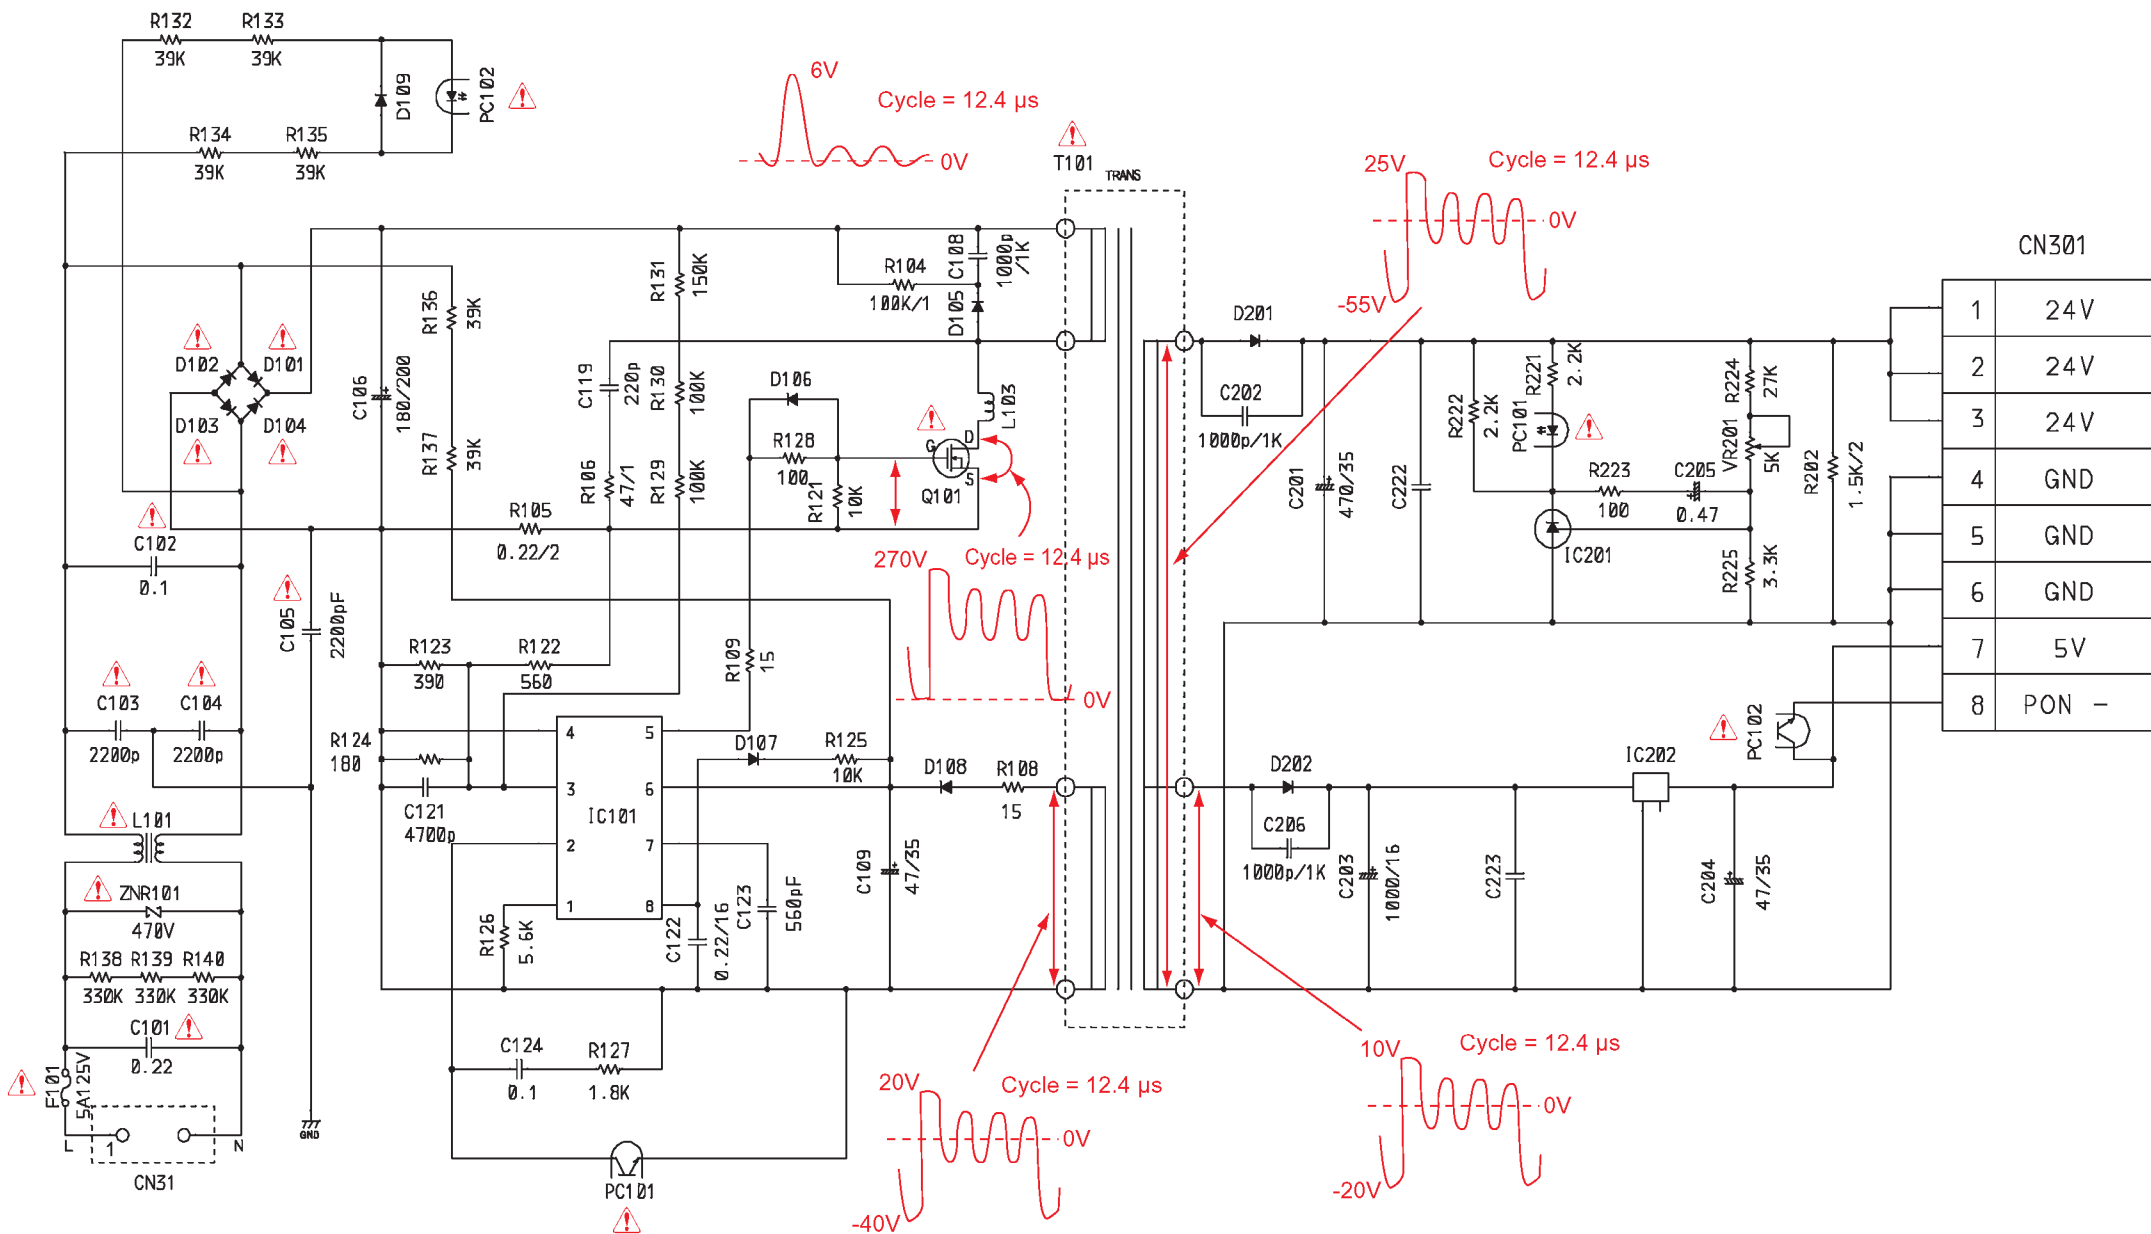

Tools and Extension Cords are useful for servicing. / (They make servicing easy.)
